CORK TILE FLOORING**

PROVIDES COMFORT, QUIETNESS  
DISTINCTIVE APPEARANCE

This member of the Armstrong family of floor coverings is a true cork product, being clean cork shavings, compressed into moulds and baked.

It possesses ten distinctive features:

Resilient and comfortable	Sanitary
Quiet underfoot	Remarkably durable in service
Non-slippery	Easy to clean
Warm to the touch	Economical
Attractive appearance	Slow-burning and fire-retarding

We are direct factory distributors for Armstrong Cork Products—flooring and insulation. Write or phone us for complete details regarding your requirements.

## As The Editor Sees It

### THE MOTIVES THAT PROMPT THE ACTIVITIES OF THE BUILDERS OF ILLINOIS AND THEIR STATE ASSOCIATION

*From an address delivered by Mr. Gerhardt F. Meyne, of Chicago, at the Annual Convention of the Associated Building Contractors of Illinois.*

The duties of the building contractor are much more difficult than one would on first thought imagine. It is a subject that every one is familiar with and yet, if you were asked, "What is the Duty of the Builder?", it would be simply necessary to imply the Moral Law.

The definition of the word "DUTY" in the sense that we Builders understand it, and as an Association understands it, as it may be applied to the subject, is as follows:

*Obedience to the Dictates of Conscience*

At their earliest inception, associations and societies were formed when two or more men banded themselves together for mutual protection against common enemies, oppression for revenge, or for defense. Later, such associations or guilds resolved themselves into commercial organizations for solely selfish purposes.

Today we are endeavoring to have associations (such as ours) serve an unselfish purpose and for the general welfare of the public. When our pagan forefathers formed associations for protec-

tive or aggressive measures, each of the persons joining would deposit some of his blood into the earth, clasp each others' hands and take an oath of allegiance. They were very formal in their ritual and discriminating regards whom they permitted to become one of their number.

With this explanation, the subject of "What is the Builder's Duty towards the Public," will be treated both as individuals and collectively as members of an association.

Broadly speaking, THE BUILDER'S DUTY TO THE PUBLIC should be to encourage and foster ideals of service to the building and general public as a basis of all worthy enterprises. If we are to organize solely for self, our association cannot endure, neither can it remain respectable or confine itself within decent ethical standards. To give full measure of service, the Builder might lean a bit backwards to fulfill every obligation.

Craft guilds were formed in the early part of the middle ages and were essential bands of men organized for mutual protection. However, they soon resolved themselves into organizations for profit, and as they waxed stronger, enjoyed monopolies that made them wealthy. Finally, they became a menace and a nuisance to the public and their existence was forbidden by the Kings, Feudal Lords and Patricians of that period, which was about the Ninth Century.

However, not daunted because of former public and official discredit, the guilds again organized and became powerful in the 14th and 16th Centuries in all sections of Europe and enjoyed monopolies or special privileges granted them by their Kings and Feudal Lords for money. But these guilds were required to register complete returns of their purposes; their foundation; their properties, etc. This was required of them that they could be held accountable for their acts, obligations and taxes. The masters, journeymen and apprentices enjoyed the benefits of these guilds whose chief purpose was to regulate and control their trade monopoly under special license from their King. The guilds' real concern was to supervise the manufacture, impose payments, royalties and restrictions on others who desired to exercise a similar privilege for livelihood.

Unless a craftsman was a member of a guild, he could not work at his trade or even join the masters of the guilds or craft. The monopolies of these guilds however, became so burdensome to the public that, it created a revolt in many countries and the guilds were gradually done away with. In England their danger was recognized and the guilds practically abolished by Act of Parliament. Their monopolies and regulations of output and prices were curbed. They became dangerous when, as trade organizations because of purely selfish motives.

**BLUE  
PRINTS**

They forgot the service they ought to have rendered to the public. Such organizations as theirs do not deserve recognition, neither should they be encouraged. Moral: If we turn selfish, we cannot live. Our State Association cannot live.

**THE BUILDER'S DUTY TOWARD THE PUBLIC** should be an active one in all matters whether civic, economic or political, and the moral welfare of the community should always be of paramount importance.

It is the builder's civic duty to keep a watchful eye on all attempted legislation, whether national, state or municipal. His peculiar knowledge and experience especially fit him to exercise a tremendous influence in encouraging helpful legislation to keep building costs within economic limits, and, discourage the enactment of laws that are vicious and contrary to good public policy. Especially should he discourage the enactment of laws that represent purely class legislation and are fostered by organizations with recognized reputations for selfishness to justify them.

*Efficiency of Labor Only Possible When in Unrestricted Competition*

The builder should initiate legislation and aggressively get behind its enactment that will forbid labor monopolies who restrict their membership to numbers, or levy exorbitant initiation fees. The builder should actively sponsor legislation that will eliminate all restrictions on the employment of apprentices and helpers. The idea being to give the American boy every opportunity to choose whichever craft may appeal to him as the craft to become apprenticed in. No union ought be permitted to exercise a monopolistic control and be permitted to decide whether our American boy may or may not become indentured in that trade which has an appeal for him. Experience has found and knows only one economic way to efficiency and that is, to have labor in unrestricted competition for employment.

Another essential condition that the builder should concern himself in, is the enactment of comprehensive laws and their enforcement that will effectively break every attempt to restrict the purchasing power of the builder and public. Combinations of material interests that either control prices or sectional allotment for distribution, should be fought from every angle. Restriction on the purchasing of material, or union label, should not be tolerated. It menaces construction activities and always advances its cost. The present laws that give building material interest special credit privileges that work harm to the unsuspecting building public should have our special attention and should be corrected. (I refer to the Mechanics' Lien Law.)

Under present prevailing conditions, Labor Unions cannot be held accountable

for their acts so they may be brought to court for breach of contract, or because of their interference with the rights of others who may choose to stand up their American constitutional rights to individually bargain for employment. There are, of course, other objectionable conditions as for instance, the restriction of output, that Labor Unions impose upon the public. All these features should be strenuously opposed by the builder in line with his duty to the public.

Everyone engaged in the building industry should participate in those movements for public welfare in which his training and experience qualify him to give competent and disinterested advice. We individually, as well as an Association, should support public officials in the proper enforcement of building codes and safety regulations and should take an active interest in the formulation and improvement of such codes.

*Duty Towards Economic Questions*

In matters economic, one great question that should interest the builder is, proper reduction of freight rates and no favorite rates for other commodities. Freight and fuel rates on building materials are so far advanced as to represent a serious question in relation to the cost of construction work. The item of rates has become a real draw-back to the industry since 1914 and presents one of the biggest inflations and watered conditions our industry has to contend with. Every builder is in duty bound to support every attempt to wring this unjustified water out of the cost of building.

Another condition that indirectly operates to the disadvantage of the building industry and the welfare of the general public, and should occupy the minds of the builder with the purpose of serving the public, is the influence tax exempt securities have in denying the building industry all the money it can, with reasonable security absorb. Tax exempt securities attract investors among the wealthy, because they do not require the payment of income tax and usually net more than real-estate securities on which taxes are assessed.

The builder's duty is to interest himself in the matter by urging either, that the interest of tax exempt securities be so reduced that such investments only offer equal inducements compared with real-estate securities, or, that the tax exempt feature be eliminated, or surtaxes reduced which will tend to bring money for building purposes. There are rears written on Taxes and the builder who is the first to be hit by high taxes should interest himself in this reduction.

It is futile for the U. S. to feel that she can live within herself. She must export, and inasmuch as we export, we get into competition with foreign labor markets, then we soon learn that we can-

## Proposal

TREASURY DEPARTMENT, Office of the Supervising Architect, Washington, D. C., August 29, 1924. SEALED PROPOSALS will be opened in this office at 3 P. M., September 22, 1924, for new mezzanine floor, changes in basement and lookouts and incidental changes in the mechanical equipment of the U. S. Post Office at Allentown, Pa. Drawings and specifications may be obtained from the Custodian of the building, or at this office, in the discretion of the Supervising Architect. Jas. A. Wetmore, Acting Supervising Architect.

(Continued from page 564)

not compete, even though we may have better machinery, more intelligence, better nourished employees. It is evident that in order to meet competition, it is necessary for labor to cut its cost, in their part of our product, or it is necessary for the other countries to raise its costs and put their employees on the scale and standard of the American workmen. It is difficult indeed to sit on Arbitration Boards and bargain with other men for others lifetime, and tell them what comforts, pleasures and existence they may have for the 8 hours that are delivered to you. Who is the employer that he shall have the right to dictate what another human being is entitled to; yet the contractor in performing his duty, which is for himself and the public, must have in mind that he cannot afford to raise the cost of his product to his neighbor, state and town, so that his neighbor cannot buy our product, or that the lessor, who is another wage earner, the clerk in the store or the other fellow employees, cannot live in the house that the builder and his labor have produced. It is indeed a difficult task to put any contractor on an Arbitration Board, for he is bargaining on one side for the lifetime of one man and on the other side for the shelter of another human being. It is strange that the labor unions have so little compassion for other men and will not concern themselves about other workmen's conditions, forgetting that their dollars are somebody else's cost of living.

### *Interchange of Ideas Among Builders*

The builder should co-operate with his colleagues in his profession by exchanging freely ideas and business methods found helpful by experience. All builders should meet one another not only in

the course of business, but socially also, with the thought of creating the best of relationship and good-will among them. Instructive campaigns teaching and discussing the most approved method on accounting, cost finding, cost keeping, overhead construction methods and even the use of machinery to speed up and reduce the cost of construction, should be constituted. Through this each builder will render a distinct and valuable service to himself and his colleagues, and the general public will be the gainer by cost reduction.

### *The Builder's Creed*

The Builder's business standards should have in them a note of sympathy for our common humanity.

The Builder's business dealings, ambitions and relations should always cause him to take consideration as his highest duties as a member of society. In every position in business life in every responsibility that comes before him, his chief thought should be to fill that responsibility and discharge that duty so that when he had ended each of them, he shall have lifted his level of the ideals and achievements of his industry a little higher than he found them.

## WHAT IS MODERN ARCHITECTURE?

BY FISKE KIMBALL

Speaking of her buildings, Henry James compared New York to "an ample childless mother, who consoles herself for her own sterility by an unbridled course of adoption." It is the current view that American architecture, under the lead of designers such as McKim, Stanford White, Charles Platt, and John Russell Pope, has turned its back on modernity and reconciled itself to a barren reproduction of the classic. It is not the true or vital view. If we consider more intently the work of this contemporary classic school, we will find it is not only creative, but that it has an underlying affinity, real though not obvious, with the progressive work in modern painting and the other arts.

In the thought of the nineties, by contrast, the insistent search for a "modern style," for an "American style," was bound up with the effort to find a new expression for modern materials and structure. Its doctrine, derived from the writings of Ruskin and Violet-le-duc in the sixties, crystallized in the mottoes: "Form follows function" and "You may decorate your construction, never construct your decoration." It was in reaction against the historical eclecticism of the mid-century, the indifferent copying of historic forms, Greek, Roman, Gothic, and Renaissance. Taking to heart the environment theory of Taine, it emphasized the novel elements in modern life,

rather than those of continuity with the past. Thus its attention was devoted primarily to the new products of modern materialism, steel and concrete, the skyscraper and the factory.

In 1895 Louis Sullivan of Chicago for the first time solved the problem of indicating the steel frame of the office building. He abandoned any wall surface in favor of a visible protective casing of the steel itself. This he accomplished in the Wainwright Building in St. Louis, and repeated and developed, the following year, in the Guaranty or Prudential Building at Buffalo. The essence of the building, its height, and the relatively greater strength of the vertical bars of the frame, he emphasized by doubling and accenting the vertical lines. The achievement in the expression of structure was widely recognized and acclaimed. Few, if any, tall buildings from 1897 to 1912 failed to show its influence, which extended far beyond the circle of consistent "modernists" who sought to abandon all historical forms. It was taken up by the eclectics, and hybridized especially with Gothic, which itself involved the tendency to structural expression and an emphasis on the vertical. The skilful use of Gothic forms in so conspicuous an instance as the Woolworth Building, in the years 1911 to 1913, gave them increased currency. Even the most determined classicists did not remain untouched. Thus in McKim, Mead and White's Municipal Building, designed in 1908, the structural lines of the steel columns were accentuated by shallow vertical strips.

A parallel achievement in the expression of concrete factory construction was made by Ernest Wilby, associated with Albert Kahn of Detroit. In designing the first Ford plant at Highland Park, the idea came of exhibiting the concrete frame itself, and filling the entire space from pier to pier with glass. Only below the sills did a low parapet wall of brick remain. The new treatment which had great practical and economic advantages, spread over the country like wildfire, and has given the American industrial building its characteristic physiognomy.

These realistic treatments of the subject matter of modern life have their obvious relation with the realistic movements in painting and sculpture, in literature and music. Painting from Courbet through the impressionists and neo-impressionists, sculpture in the hands of Carpeaux, Meunier, and Rodin, the music-drama of Wagner, the novels and plays of Tolstoi, Flaubert, Zola, and Ibsen, all seek characteristic beauty through truth to nature rather than abstract beauty through relations of form. And while, nevertheless, the men of fundamental greatness in the other arts, as in architecture preserved a sense of form,

the lesser men and the imitators fell into the formlessness which we see for instance, in Monet's successors.

Against this formlessness of the impressionists this scientific observation of nature, this equation of beauty with truth, there began a reaction, even before 1890. Cezanne wrote "One must compose by the cylinder, the sphere, and the cone," and he let anatomy and photographic foreshortening give way. Bourdelle, Maillol, and Mestrovic became "archaic" and geometrical. The symbol replaced the statement of objective fact. Representation itself has been discarded by painting and sculpture in some instances, and the possibility of a purely abstract art of form and color asserted. In literature there has been a renaissance of verse, with a multitude of novel experiments in form. Music has tended to abandon its programmatic and representative efforts to express extraneous ideas, and to revert to its own language, enriched by new scales and tonalities.

In the architecture of the past the pre-eminent manifestations of pure or abstract form, as against a structural or sculptural emphasis, have doubtless been in the classic styles. Periods of renewed interest in unity and purity of form, such as those of the fifteenth and eighteenth centuries, have coincided with reversions to the classic elements, which have come to constitute a universal language, of elementary geometrical simplicity. It is in this sense that we must interpret the new revival of the classic which has decidedly gained the upper hand in American architecture during the last generation.

It is important to note that this movement in its origins owed little to contemporary Europe and that it has remained American in leadership. Although the leaders have been men of European training, it has not been the style of their French masters which has determined theirs. McKim and White came back from France with their portfolios full of picturesque high-roofed chateaux, such as Hunt, their predecessor at the Ecole des Beaux-Arts, had already been transplanting here. Their initial works, whether showing the influence of Richardson or of the Queen Anne period, were themselves romantic in composition. The earliest work in a new manner, one which in the sequel assumes importance of the first magnitude, was the group of Villard houses in New York, built in 1885 on Madison Avenue between Fiftieth and Fifty-first Streets. The four houses were not individually differentiated, but were welded into a single great palace, simple and uniform, its details suggested by the Italian Renaissance. When I once asked Mr. Mead how this sudden departure came to pass in the work of the firm he spoke of the gifted and unfortunate Joseph Morrill Wells, one of the design-

ers and showed me Wells's two sober drawings of the Farnese Palace and Les-cot's wing of the Louvre, still on the walls of the office, representing his classic ideals, which became the ideals of his great associates.

A series of influential works quickly followed, the most notable being the Boston Public Library, for which McKim's uniform and majestic competitive design was adopted in 1888. Then came the marvelous phantasm of 1893 at Chicago, in which the unsubstantial realities of wood and plaster were bodied forth in an ideal splendor and harmony of form. Here McKim himself was rivaled and outdone by Charles Attwood in his two superb designs of the Persistyle and the Fine Arts Building, the latter a masterpiece which well deserves the promised resurrection from its sad decay. The effect on current practice was electrical. Almost overnight the whole public architecture of the country was turned into a monumental and classical channel. When, in 1901, McKim and Burnham made the great plan for the architectural development of Washington, the movement found a nationalistic sanction in the buildings of the early republic, unparalleled abroad in their literal adherence to the classic ideal.

Although, to many later works of the school, the Ecole des Beaux-Arts has contributed its analytical science of planning, it is a mistake to suppose the movement itself to be, as Jacques Greber has asserted, "preuve de la force d'expansion de la genie francese." The scores of *eleves* who have returned from the unrivaled discipline and emulation of the Paris school have had here to lay aside their French language of form, based on characteristic emphasis and on lavish, dynamic energy, to learn anew a language of almost mathematical simplicity and of Dorian harmony. Not one has permanently escaped the overwhelming domination of the American classic.

Even the citadel of functionalism, the skyscraper, has finally been captured. In 1912 there rose in upper Fifth Avenue the building of the Century Holding Company, the first of the "millionaire apartments," at the corner of Eighty-first Street. Here McKim, Mead and White no longer compromised, but were true to their own implicit theory of form that "instead of constructing first, without preoccupation with the final appearance, promising oneself to utilize the ingeniousness of the construction as the decoration, one should relegate the ingenuities of structure to a position among the secondary means, unworthy of appearing in the completed work." The steel frame disappeared again behind sheer, unbroken walls, the merits of which lay in uniformity and proportion. Almost simultaneously came Charles Platt's Leader-News Building in Cleve-

land with its vast plane surfaces of grooved stone. Now the multitude of high apartment buildings east of Central Park follows the new precedent with one accord, and the Federal Reserve Bank raises its sheer cliffs of unbroken masonry in the narrow lanes downtown. For better or worse, the struggle to express the steel frame, so burning in the nineties, has become a dead issue.

Meanwhile foreign conquests have begun. The French, who made fun of the plaster colonnades at Chicago in 1883, reproduced them at the Paris exposition of 1900, so unlike all its European predecessors. The English, abandoning their long tradition of ridicule, are frank in admiration. The leaders of the new generation, such as Adshead, Richardson, and Atkinson, know America well. They have modeled their schools on ours, and are striving to bring about a revival of their own fine classic architecture of 1800. The young pensioners of the Royal Institute have already come to America to study, more than once; and now with the founding of the Bossom scholarship they will do so as a regular practice. They are not interested merely in the commercial and material aspects of American architecture, but equally in the largeness and simplicity of style. With the building of Bush House in the Strand, the first conspicuous monument of this style on English soil, the buzz of admiring tongues tells us that in architecture American hegemony is won.

In the never-ending flux of artistic creation, what is the "modern" of one generation is no longer the modern of the next. We may admire the apt epigram of the nineties, but if we persist in repeating it, it becomes a platitude of today.

In art, unlike science, there is no single "right" way. Only to stand still is wrong, since it belies the imaginative and creative nature of art itself. Which way is forward at the moment is determined only by the march of events. If the procession turns south, those who still continue westward are condemned henceforth to insignificance. Such a great change of front has taken place in our day. Wells and McKim, White and Attwood, we now see, did not lead merely the rear-guard of a belated historic revivalism, but a new van. In their apparent classicism, the architects are really marching side by side with the modernists in sculpture and painting—alike votaries of a new worship of abstract beauty of form.

—The Nation.

The man with an order to place doesn't hunt you up in the city directory these days. He hasn't the time. If he can't find you in your trade magazine he can and does find somebody else, and that somebody else books the order.

## Changing an Attitude of Mind

It has been the tendency of the public to look upon insurance as something on which it must first be "sold" by convincing arguments of the insurance man.

That this attitude is undergoing a change is evidenced in the number of people who no longer wait for the agent to solicit their business but who seek out the agent and ask for insurance advice.

By its national advertising the Insurance Company of North America is helping materially to bring about that hoped for time when people will "consult their insurance agent as they consult their doctor or lawyer."

Represent North America.

**LINOTILE  
FLOORS****Have Character**

Unusually effective designs are obtained with Armstrong's Linotile Flooring. As its name indicates Linotile is tile made and laid in separate units, and not being supplied in sheets or in set patterns is capable of wide expression in design.

But aside from the effective designs, Linotile is

Resilient  
Non-slippery  
Silent underfoot  
Warm  
Sanitary

Easy to clean  
Odorless  
Artistic  
Durable  
Reasonable in cost

We shall be glad to give you full details of the wonderful possibilities of Linotile as a flooring for residences, banks, offices, public buildings, etc.

## As The Editor Sees It

### THE BUILDING SITUATION

In view of statements current in some portions of the press that a depressed condition exists in the construction industry, the Department of Commerce issued a statement September 2nd calling attention to the immediate situation as compared with conditions a year ago. The value of contracts let in thirty-six states in July, 1924, shows an increase of 10 per cent. over that of a year ago, and the total contracts let from January 1 to the end of July, 1924, also gained 10 per cent. over the same period of 1923. Practically all classes of construction contributed to the increase, although in varying degree, just as there has been relatively greater activity in some cities and districts than in others.

Residential contracts for July this year show an increase of 3 per cent. over those of last July; industrial and commercial building combined show 3 per cent. increase; public works and utility construction 10 per cent. increase; educational buildings, 26 per cent. increase; and miscellaneous, including hospitals and institutions, religious and memorial buildings, and public buildings, 42 per cent. increase.

Cement shipments from the mills in July increased 21 per cent. over the same month last year, and for the seven months ended July were 4 per cent. higher.

Although there was some decrease in lumber production during the first seven

months of the year, orders for lumber reported by eight leading associations during six weeks ending the middle of August show an increase of 29 per cent. over the same period of last year.

There has been some recession in the cost of construction. The Department of Commerce index number for frame house materials shows a decrease in 12 months from 214 to 199, compared with 1913 as 100, and for brick house materials, from 217 to 201. Other index numbers show a decrease in general construction costs from 222 to 214.

The annual meeting of the American Construction Council for 1924 will be held on October 2nd and 3rd in New York City.

Aside from the regular business sessions of the Council and the meetings of the Board of Governors and its Executive Committee, the following subjects are among those on the program for the general sessions:

1. BETTER BUILDING:—Discussion of ways and means to insure better quality of construction and the promotion of greater responsibility among all elements having to do with construction. Report of the Council's committee on better building.

2. ENGINEERING CONSTRUCTION:—Discussion of fundamental relationships between the elements of the industry pertaining to engineering con-

struction, including field projects, highway construction, public carriers, etc.

3. APPRENTICESHIP:—A survey of the apprenticeship movement for the building trades throughout the country. Report of the Council's committee on apprenticeship and its affiliated groups.

4. THE BUILDING CONGRESS MOVEMENT:—Group meeting of the various local Building Congresses throughout the country. Discussion of principles and procedure underlying the organization and administration of Building Congresses for given localities.

### MANY STATES BENEFIT BY ZONING LEGISLATION

Approximately 24,000,000 people, living in 261 municipalities throughout the United States, are enjoying the benefits of zoning, according to statistics compiled by the Division of Building and Housing of the Department of Commerce. The greatest zoning center in the territory in New York State and northern New Jersey, having New York City for its hub; other centers are in California, Ohio, Massachusetts, Illinois and Wisconsin.

Secretary Hoover, in a recent statement, characterized properly drawn zoning ordinances as "reasonable, neighborly agreements as to the use of land." They divide a city into districts in which are limited the use to which land and

**BLUE  
PRINTS**

structures may be put; the height and number of stories of the buildings; and the areas of the lots to be occupied by the buildings. Their professed object is to regulate the use of private real estate for the purpose of promoting health, safety, morals and the general welfare of the entire community.

That the idea has made a strong appeal to the American people is shown by the rapid spread of zoning. On January 1, 1923, there were only 129 zoned cities, towns and villages. The first comprehensive effort to zone was the passage of a zoning ordinance by New York City in 1916; although Los Angeles, Calif., passed a "Use" ordinance in 1909, and Boston, Mass., regulated the height of buildings in 1904.

Cities towns and boroughs throughout the country generally are showing more than a passing interest in zoning. Where authority is granted, various municipalities are actively engaged in the solution of their zoning problems with enthusiastic zoning commissions and auxiliary committees at work. Even where state legislation does not authorize zoning, various public-spirited and progressive organizations are studying the local situation so that when zoning can be effected legally, much of the preliminary work will be finished.

New Jersey leads in the number of zoned municipalities, having 66; New York has 41; California has 33; Illinois, 25; Massachusetts, 24; Ohio, 16; Wisconsin, 13; Indiana, 5; Michigan and Missouri, 4 each; Iowa and Rhode Island, 3 each; Florida, Michigan, Oklahoma, Pennsylvania, Virginia and Washington, 2 each; and Arkansas, Colorado, Connecticut, Georgia, Maryland, Nebraska, North Dakota, South Carolina, Tennessee, Utah and the District of Columbia, see, North Carolina, Utah and the District of Columbia, one each.

\* \* \*

With 41 new municipalities reported since January 1, 1924, the number of zoning ordinances now in effect throughout the United States totals 261. In ad-

dition the City of Boston adopted a comprehensive ordinance while Omaha, Nebraska, revised its comprehensive ordinance.

The municipalities, with details as to the date and character of the ordinances, are given below.

"Comp." means a comprehensive zoning ordinance regulating "use," "height" and "area" of buildings. The figures give the date of adoption:

ARKANSAS: Little Rock, (Interim), 1924.

CALIFORNIA: Bakersfield, Use, 1923; Burbank, Use and Height, 1923; Burlingame, Use, 1923; Glendale, Use, 1922; Inglewood, Use, 1924; Redwood City, Use, 1921; San Mateo, Use 1922; Terrance, Use and Height, 1923; Ventura, Comp., 1924.

CONNECTICUT: West Hartford, Comp., 1924.

DELAWARE: Wilmington, Comp., 1924.

FLORIDA: Orlando, Use, 1924.

MASSACHUSETTS: Arlington, Comp. 1924; Boston, Comp., 1924; Dedham, Use, 1924; Haverhill, (Interim); Lexington, Comp., 1924; Malden, Use, 1923; Medford, (Interim); Melrose, Comp., 1924; Swampscott, Use, 1924; Winchester, Use and Height, 1924.

MINNESOTA: Minneapolis, Comp., 1924.

NEBRASKA: Omaha, Comp., (Revised), 1924.

NEW JERSEY: Englewood, Comp., 1923; Fanwood, Use, 1924; Linden, Use, and Height, 1921; Pompton Lakes, Use, 1923.

NEW YORK: Albany, Comp., 1924; Dobbs' Ferry, Comp., 1924; Elmsford, Comp., 1924; Greenburgh, Comp., 1924; Hastings, Comp., 1923; Lawrence, L. I., Use, 1923; Lynbrook, Comp., 1924; Rockville Centre, Comp., 1924.

NORTH DAKOTA: Bismarck, Comp., 1924.

OHIO: Cincinnati, Comp., 1924.

OKLAHOMA, Tulsa, Comp., 1923.

Residence of U. S. EPPERSON  
Country Club District, Kansas City, Mo.

Heated by a No. S 8-40 Novelty Carburetor Boiler. Architect: Horace La Pierre, Kansas City. Heating Contractor: E. K. Campbell Heating Co., Kansas City. Vapor System—Direct Radiation, 3715 Sq. Ft.

## Another Tribute—

In magnificence and scope the Country Club District of Kansas City, Mo., recognizes no peer. The outstanding residence of this famous section is the home of U. S. Epperson, Esq. (Cost over \$1,500,000.)

The fact that a Novelty Carburetor Boiler was selected for this architectural achievement is another tribute to the prestige and efficiency of this newest patent heating boiler, which has been installed in a notable array of fine buildings all over the nation.

Cheap oil is used as fuel. From the first—three years ago—the Epperson home has been cosy and warm as well as architecturally impressive.

Burns any kind of fuel without smoke and with exceptional freedom from heat losses. The carburetor chambers on the rear of the boiler automatically mix all smoke and carbon, ordinarily wasted, with oxygen from the air—and burn them. The air enters top and bottom slot of the carburetors, as shown in the picture. *No adjustment of air intake is necessary.* Rate of combustion determines amount of air required.

*Write for illustrated and descriptive booklet. There are facts in it you would like to have at your finger tips.*

### Contracts Awarded

**Bridge**, 75-34, North of Hamberg, Pa. Architect, private plans. Owners, Philadelphia & Reading Railroad, Twelfth and Market streets, Philadelphia. Reinforced concrete steel. Contract awarded on grading and masonry to H. Denberger, Bethlehem, Pa. On waterproofing, Johns Manville Co., 210 North Broad street, Philadelphia.

**Road Work**, Pennsylvania. Owners, Department of Highways, Harrisburg, Pa.

Venango County, A-2276, Oil Creek Township, 24,871 feet. Either bituminous surface course on concrete foundation or one course reinforced concrete. Contract awarded William W. Wilt, Franklin, Pa. \$67,563.85.

Venango County, A-2004, Sugar Creek Township, 5,002 feet. One course reinforced concrete. \$196,163.05. Contract awarded to Colonial Const. Co., Pittsburgh, Pa.

York County, R-333, Newberry, Conewago and Manchester Townships. One course reinforced concrete. \$432,106.75. Contract awarded to Ambler-Davis Co., Harrison Building, Philadelphia.

Erie County, R-258, A-2883, 2908, McKean Township, Middleboro Borough, 19,950 feet. Either bituminous surface course on concrete foundation or one course reinforced concrete. \$169,991.18. Contract awarded to Jamieson & Narlee Co., Fredonia, Pa.

Lycoming County, A-1381, Clinton Township, 13,406 feet. One course reinforced concrete. \$124,969.11. Contract awarded to Thomas B. Evans, Danville, Pa.

**Dormitories, Boiler House and Moving of Observatory**, Lancaster. Architects, Day & Klauder, 1416 Chestnut street, Philadelphia. Owners, Franklin and Marshall College, Lancaster, Pa. Brick, cut stone, steel, reinforced concrete, Franklin Hall and Byron Hall, 3 stories, 118x34 feet, Duty Hall and Dantie Hall, 3 stories, 118x34 feet, slate roof, cement floors, plumbing, waterproofing, ornamental iron work, bond, kalamein doors, marble and terrazzo work, metal lath, electric light, vacuum heat (Reading wrought iron pipe, Reading or Byers galvanized iron pipe, fireproofing. Contract awarded to Herman Wohlsen, Lancaster, Pa.

**Gymnasium**, Lancaster, Pa. Architect, William C. Prichett, 225 South Sixth street, Philadelphia. Owners, Franklin and Marshall College, Lancaster, Pa. Brick, stone, steel, 1½ stories, 129x57 feet 10 inches (plumbing, heating, electric reserved), slate roof, cement and pine floors, hollow tile, waterproofing, ornamental iron work, bond, rolling steel sash, marble work, Reading or Byers iron pipe. Contract awarded Herman Wohlsen, Lancaster, Pa.

**Rectory**, Tuscarora, Pa. Architect, G. C. Freeman, Liberty Bank Building, Reading, Pa. Owners, St. Raphael's Roman Catholic Church, Rev. E. J. Boyle, Tuscarora, Pa. Brick, 2 stories, 32x38 feet, shingle roof, hardwood floors (heating reserved), electric light, tile work. Contract awarded to D. Hopples, Tamagua, Pa.

**Rectory**, Minersville, Pa. Architect, G. C. Freeman, Liberty Bank Building, Reading, Pa. Owners, St. Stanislaus' Polish Church, Rev. A. K. Bizonoski, Minersville, Pa. Brick, 2½ stories, 32x47 feet, slate roof, hardwood floors, hot water heat, electric light, tile work.

Contract awarded to Mr. Flail, Pottsville, Pa.

**Office Building (alts. and add.)**, Harrisburg, Pa. Architects, Lawrie & Green, 116 Locust street, Harrisburg, Pa. Owners, Pennsylvania State Chamber of Commerce, Harrisburg, Pa. Brick, limestone, 3 stories, 30x30 feet, tin roof, cork, hardwood and tile floors, central heat, electric light, tile work, metal stairs. Contract awarded to Central Const. Co., Seventh and Emerald streets, Harrisburg, Pa.

**Residences (17)**, Lancaster, Pa. Architect, H. Y. Shaub, 20½ North Queen street, Lancaster, Pa. Owners, Heidelbaugh Coal Co., Lancaster, Pa. Brick, 2 stories, 20x30 feet, hot air heat, electric light, pine floors. Contract awarded to Walter Zook, Lancaster, Pa.

**Chester Central Office Building (alts.)**, 20 East Fifth street, Chester, Pa. Engineer, Engineer of Buildings, 261 North Broad street, Philadelphia. Owners, Bell Telephone Co., Seventeenth and Parkway, Philadelphia. Brick, masonry, carpentry and mill work, cement work, electric wiring, heating alterations, metal work, painting and glazing, plastering, plumbing alterations, tile work. Contract awarded Knox Landers, 1132 Vine street, Philadelphia.

**Road Work**, Pennsylvania. Owners, Pennsylvania Department of Highways, Harrisburg, Pa.

Fayette County, A-1216, Nicholson Township, 9,024 feet. One course reinforced concrete. \$83,441. Contract awarded to Georges Const. Co., Uniontown, Pa.

Northumberland County, R-18, Turbot and Delaware Townships and Watsonstown Borough, 11,041 feet. One course reinforced concrete. Contract awarded to Walter A. Godcharles, Milton, Pa. \$89,858.69.

Franklin County, A-585, Quiney Township and Mont Alto Borough, 11,862 feet. One course reinforced concrete. \$96,900.12. Contract awarded to Frey Const. Co., Inc., York, Pa.

Owners taking bids due as soon as possible.

**Police Station (alts.)**, South Broad street, Trenton, N. J. Architect, J. O. Hunt, Hunt Building, Trenton, N. J. Owners, City of Trenton, care of Commissioner La Barre, City Hall, Trenton, N. J. Steel lockers, gymnasium equipment, screening. Owners taking bids due September 19th.

**Bridges (2)**, Atlantic County, N. J. County engineer, A. H. Nelson, Atlantic City, N. J. Owners, Board of Chosen Freeholders of Atlantic County, Atlantic City, N. J. Bridge No. 23, Weymouth Dam, Hamilton Township. Bridge No. 45, South River, Hamilton Township. Owners taking bids due September 11th.

**Detention House**, Pensauken, Camden County, N. J. Architects, Lackey & Hettle, 5 Hudson street, Camden, N. J. Owners, Board of Chosen Freeholders Camden County, F. G. Riggins, Camden. Low bidders: J. M. Yardley, 1730 Sansom street, Philadelphia, \$194,791; H. John Homan Co., Eighteenth and Cherry streets, Philadelphia, \$198,990.

## New Jersey

### Contracts Awarded

**Jail**, Atlantic City, N. J. Architect, H. A. Stout, Guarantee Trust Building, Atlantic City. Owners, City of Atlantic City, Atlantic City, N. J. Contract awarded to Lam Building Co., 1001 Wood street, Philadelphia.

**Residence and Garage**, Merchantville, N. J. Architect, Dale Truscott, 225 South Jessup street, Philadelphia. Owner, David Lynn Truscott, Merchantville, N. J. Brick, steel, cut stone, 2½ stories and 1½ stories, 72x38 feet, garage 24x18 feet, slate roof, linoleum, oak, pine and cement floors, painting and glazing, waterproofing, ornamental iron work, bond, tile work, metal lath, flagstone. Contract awarded Carl E. Widell, Woodiynne, N. J.

### "INCREASED INTEREST AT ZONING LAWS"

The people of the United States are showing an increased interest in zoning to control the use, height and area of buildings in various districts of their communities, and in consequence zoning laws have been enacted or are being considered by nearly every state in the Union. The first step is to adopt a state zoning enabling act after which the authorities of the cities, towns, boroughs, villages or other municipalities may adopt zoning ordinances to fit local conditions.

Thirteen of the states that have enacted zoning legislation since January 1, 1923, have used all or a substantial portion of "A Standard State Zoning Enabling Act," which was prepared by the Advisory Committee on Zoning of the Department of Commerce to serve as a model for those desiring to introduce zoning legislation in their States. The great care used in

the preparation of the Standard Act had much to do with its favorable reception.

During 1925 the legislatures of 34 states will meet, most of them early in January, and it is expected that zoning legislation will occupy a prominent place on the legislative calendars. In nine of these states which have not as yet passed zoning legislation, various groups plan to have zoning enabling acts considered early in the sessions. In some of the other 25 states, which now have zoning laws, plans are being made to extend the application of their acts since they grant the privilege of zoning only to single cities or specific groups.

The thirteen states which have used the Standard Act in whole or in part since its tentative publication in 1923, are as follows:

COLORADO: Acts of 1923, Chapter 182.

DELAWARE: Laws of 1923, H. B. No. 29.

ILLINOIS: Laws of 1923, H. B. No. 478.

IOWA: Laws of 1923, Chapter 134.

NEVADA: Laws of 1923, Chapter 125.

NEW JERSEY: Laws of 1924, Chapter 146.

NORTH CAROLINA: Laws of 1923, Chapter 250.

NORTH DAKOTA: Laws of 1923, H. B. No. 8.

OKLAHOMA: Laws of 1923, H. B. No. 204.

PENNSYLVANIA: Laws of 1923, Act 93.

RHODE ISLAND: Acts of 1923, Chapter 2315.

SOUTH CAROLINA: Laws of 1924.

WYOMING: Acts of 1923, Chapter 78.

### TOO MANY ODD SIZE DOORS. MILLWORK COMPANIES CLAIM; SEEK SIMPLIFICATION !

Likelihood of early surveys leading to a reduction in the types and sizes of doors manufactured by the millwork industry throughout the country has been indicated by the Division of Simplified Practice, Department of Commerce. Suggestions for such action have come to the Division from two important sources. One of these the Southern Sash Door and Millwork Manufacturers' Association in a convention held recently in Asheville, N. C., adopted formal resolutions endorsing the lumber standardization program adopted a few months ago and which became effective on July 1. The other was from a big manufacturing company in Tacoma, Washington.

"We are wondering," wrote this firm, "if some action could not be taken in the stock door industry to eliminate many needless types and sizes of doors which

the manufacturers are called upon to make. \* \* \* There are certain standard types and sizes of doors which constitute the bulk of the doors manufactured in stock factories. There are, however, many customers who order a stock pattern, but who insist on some slight deviation, usually for no better reason than the fact that they have always received them in this way before. \* \*

"We are confident that the stock door factories in this section would welcome some effort to simplify the business. \* \* We also believe that the distributors and dealers in sash and doors would be in favor of such a movement."

Indications have shown that Southern dealers in this commodity are heartily in favor of a simplification of sash, doors and millwork generally; and the subject is being investigated in other sections of the country to ascertain the reactions of the distributors and dealers, the Division reported.

The Radiator Cabinet Company has recently been organized as a subsidiary of the Sheffler-Gross Company, Inc., to market the Ja-Nar Radiator Cabinet, manufactured by the Fulton Company, Knoxville, Tenn. - This Cabinet is designed to cover radiators and do away with the soiling of walls and draperies which is such a common sight with bare radiators. At the same time, the radiators are converted into beautiful pieces of furniture and can be made to harmonize with the interior. These Cabinets are made of a high grade of furniture steel with a wood finish or solid color finish, baked enameled on the surface. The interior of the Cabinet is insulated with a very high grade of heat fibre which has the same insulating properties as 8 inches of brick, thereby, allowing the outside of the cover to be at the same temperature as the room air. On this account, flowers can be placed on the top of this Cabinet as well as vases or other artistic objects. At the same time recessed radiators can be concealed so that the front of the cabinet can be made flush with the wall. These Cabinets are made in three styles as follows:

*First:* With a Thermostatic Control to open and close a series of shutters behind the openings in the Cabinet, thereby assuring a uniform temperature in the room.

*Secondly:* With a hand control, whereby, these shutters can be opened and closed by a little lever handle placed on the outside of the Cabinet.

*Thirdly:* Just as the ordinary Cabinet without any kind of control.

As there is sufficient clearance around the radiator and correct insulation with an opening at the bottom, the covering of the radiators does not decrease at all the heating efficiency.

The Radiator Cabinet Company is equipped to furnish radiator shields, grilles and other materials covering the entire field of radiator concealment.

The Annual Meeting of the Philadelphia Builders' Exchange and Employers' Association will be held Tuesday, September 16th, 2.00 P. M., at the Exchange's offices, 1716 Arch Street, when the result of the election of Officers and Directors for the ensuing year will be announced, and when such other business will be transacted as may properly come before the organization at that time.

### STANDARD CONSTRUCTION CONTRACTS READY

*Documents for Building and Railroad Work Prepared*

**T**HE Joint Conference on Standard Construction Contracts after some two and a half years of effort devoted to the formulation of contract principles based upon sound economics, has embodied the results of its work into two forms of contract, one for the construction of buildings and one for the construction of engineering projects.

The first tentative draft of these documents was printed and distributed for criticism in April, 1922, the second draft in November, 1922, and the third draft, which completed the work of the conference on these two forms, in March, 1924. The third draft is issued by the Joint Conference in the belief that it represents the best expression of principles that the architectural, engineering and contracting world is prepared at this time to accept.

In the present documents, the right of arbitration is limited to matters of time and financial consideration, thus reserving to the architect or engineer final decision in technical and other matters. This type of arbitration, the form most widely approved in the associations represented, is believed to have overcome the principal objections to the use of arbitration in construction.

The following resolution passed by the Conference at the meeting in Washington, March 20, 1924, outlines its attitude with respect to the forms issued.

#### *Resolution*

"WHEREAS, The Joint Conference on Standard Construction Contracts has spent over two years in investigating, discussing and formulating contract provisions for use in construction work, and

has twice during that time printed and distributed for discussion and criticism the tentative provisions developed; and

"WHEREAS, During this procedure the various groups of thought presented have been analyzed and co-ordinated into contract provisions, based upon sound economics, and designed to establish more uniform contracting practices; and

"WHEREAS, The Conference recognizes that certain National Associations are reluctant to accept a universal contract form with modification of some of its provisions for their particular needs, but believe that in time a practical uniformity of contract practice can be established if leading National Associations interested in construction will endorse and recommend use of the principles approved by the Conference; and

"WHEREAS, The Conference has adopted a contract form for building construction, and a form for general engineering construction, which in its judgment presents the best practice that the architectural, engineering and contracting world is now prepared to accept.

"THEREFORE BE IT RESOLVED: That these two contract forms be submitted to each of the constituent bodies of the Conference with the urgent request that each confirm the conclusions of the Conference, and that these contracts be used wherever possible to the exclusion of other contract forms and with as little change or modification as possible."

In order to avoid any danger of destroying the copy-rights on existing standard documents, parts of which the Joint

**STANDARD AGREEMENT FOR CONSTRUCTION OF BUILDINGS**

*Issued by the Joint Conference on Standard Construction Contracts*

THIS AGREEMENT made the ..... day of ..... in the year Nineteen Hundred and ..... by and between ..... hereinafter called the Contractor, and .....

...hereinafter called the Owner, WITNESSETH, that the Contractor and the Owner for the considerations hereinafter named agree as follows:

*Article 1. Scope of the Work*—The Contractor shall furnish all of the materials and perform all of the work shown on the Drawings and described in the Specifications entitled

(Here insert the caption descriptive of the work as used on the Drawings and in the Other Contract Documents) prepared by ..... acting as, and in these Contract Documents entitled the Architect; and shall do everything required by this Agreement, the General Conditions of the Contract, the Specifications and the Drawings.

*Article 2. Time of Completion*—The work to be performed under this Contract shall be commenced ..... and shall be substantially completed .....

(Here insert stipulation as to liquidated damages if any.)

*Article 3. The Contract Sum*—The Owner shall pay the Contractor for the performance of the Contract, subject to additions and deductions provided therein in current funds as follows: ..... State here the lump sum amount, unit prices, or both, as desired in individual cases.)

Where the quantities originally contemplated are so changed that application of the agreed unit price to the quantity of work performed is shown to create a hardship to the Owner or the Contractor, there should be an equitable adjustment of the Contract to prevent such hardship.

*Article 4.—Progress Payments*—The Owner shall make payments on account of the Contract as provided therein, as follows:

On or about the ..... day of each month ..... per cent of the value based on the Contract prices, of labor and materials incorporated in the work and of materials suitably stored at the site thereof up to the first day of that month, as estimated by the Architect, less the aggregate of previous payments; and upon substantial completion of the entire work, a sum sufficient to increase the total payments to ..... percent of the contract price.

(Insert here any provision made for limiting or reducing the amount retained after the work reaches a certain stage of completion.

*Article 5. Acceptance and Final Payment*—Final payment shall be due ..... days after substantial completion of the work provided the work be then fully completed and the Contract fully performed.

Upon receipt of written notice that the work is ready for final inspection and acceptance, the Architect shall promptly make such inspection, and when he finds the work acceptable under the Contract

and the Contract fully performed he shall promptly issue a final certificate, over his own signature, stating that the work provided for in this Contract has been completed and is accepted by him under the terms and conditions thereof and that the entire balance found to be due the Contractor, and noted in said final certificate, is due and payable.

Before issuance of final certificate the Contractor shall submit evidence satisfactory to the Architect that all payrolls, material bills and other indebtedness connected with the work have been paid.

If after the work has been substantially completed full completion thereof is materially delayed through no fault of the Contractor and the Architect so certifies, the Owner shall, upon certificate of the Architect, and without terminating the Contract, make payment of the balance due for that portion of the work fully completed and accepted. Such payment shall be made under the terms and conditions governing final payment, except that it shall not constitute a waiver of claims.

*Article 6. The Contract Documents*—The General Conditions of the Contract, the Specifications and the Drawings, together with this Agreement form the Contract, and they are as fully a part of the Contract as if hereto attached or herein repeated. The following is an enumeration of the Specifications and Drawings: (enumeration is inserted here.)

IN WITNESS WHEREOF the parties hereto have executed this Agreement, the day and year first above written.

(Index appearing above is carried here in document.)

*Art. 1. Definitions.*

(a) The Contract Documents consist of the Agreement, the General Conditions of the Contract, the Drawings and Specifications, including all modifications thereof incorporated in the documents before their execution. These form the Contract.

(b) The Owner, the Contractor and the Architect are those mentioned as such in the Agreement. They are treated throughout the Contract Documents as if each were of the singular number and masculine gender.

(c) The term subcontractor, as employed herein, includes only those having a direct contract with the Contractor and it includes one who furnishes material worked to a special design according to the plans or specifications of this work, but does not include one who merely furnishes material not so worked.

## Changing an Attitude of Mind

It has been the tendency of the public to look upon insurance as something on which it must first be "sold" by convincing arguments of the insurance man.

That this attitude is undergoing a change is evidenced in the number of people who no longer wait for the agent to solicit their business but who seek out the agent and ask for insurance advice.

By its national advertising the Insurance Company of North America is helping materially to bring about that hoped for time when people will "consult their insurance agent as they consult their doctor or lawyer."

Represent North America.

## For Permanently Hard and Waterproof Concrete

THE addition of "ANTI-HYDRO," a liquid integral compound, to the gauging water produces extremely hard and absolutely waterproof concrete all in **one operation**.

For waterproofing concrete cellars, walls, foundations, pits, stucco, mortar, etc., "ANTI-HYDRO" has no equal. It is easy and economical to use—simply mix it with the gauging water.

For 20 years "ANTI-HYDRO" has given complete satisfaction on every type of concrete hardening and waterproofing work.

Stock carried by The Van Sciver Corporation, Parkway at 24th Street, Philadelphia.

## As The Editor Sees It

### STANDARD AGREEMENT FOR CONSTRUCTION OF BUILD- INGS

Issued by the Joint Conference on Stand-  
ard Construction Contracts

(Continued from last issue)

- (d) Written notice shall be deemed to have been duly served if delivered in person to the individual or to a member of the firm or to an officer of the corporation for whom it is intended, or if delivered at or sent by registered mail to the last business address known to him who gives the notice.
- (e) The term "work" of the Contractor or Subcontractor includes labor or materials or both.
- (f) All time limits stated in the Contract Documents are of the essence of the contract.
- (g) The law of the place of building shall govern the construction of this Contract.

*Art. 2. Execution, Correlation and Intent of Documents.*—In case the Owner and Contractor fail to sign the General Conditions, Drawings or Specifications, the Architect shall identify them.

The Contract Documents are complementary, and what is called for by any one shall be as binding as if called for by all. The intention of the documents

is to include all labor and materials, equipment and transportation necessary for the proper execution of the work. It is not intended, however, that materials or work not covered by or properly inferable from any heading, branch, class or trade of the specifications shall be supplied unless distinctly so noted on the drawings. Materials or work described in words which so applied have a well known technical or trade meaning shall be held to refer to such recognized standards.

*Art. 3.—Detail Drawings and Instructions.*—The Architect shall furnish with reasonable promptness, additional instructions, by means of drawings or otherwise, necessary for the proper execution of the work. All such drawings and instructions shall be consistent with the Contract Documents, true developments thereof, and reasonably inferable therefrom. The work shall be executed in conformity therewith and the Contractor shall do no work without proper drawings and instructions.

The Contractor and the Architect, if either so requests, shall jointly prepare a schedule, subject to change from time to time in accordance with the progress of the work, fixing the dates at which the various detail drawings will be required, and the Architect shall furnish them in accordance with that schedule. Under like conditions, a schedule shall be prepared, fixing the dates for the submis-

sion of shop drawings, for the beginning of manufacture and installation of materials and for the completion of the various parts of the work.

*Art. 4. Copies Furnished.*—Unless otherwise provided in the Contracts Documents the Architect will furnish to the Contractor free of charge, all copies of drawings and specifications reasonably necessary for the execution of the work.

*Art. 5. Shop Drawings.*—The Contractor shall submit with such promptness as to cause no delay in his own work or in that of any other Contractor, two copies of all shop or setting drawings and schedules required for the work of the various trades, and the Architect shall pass upon them with reasonable promptness. The Contractor shall make any corrections required by the Architect, file with him two corrected copies and furnish such other copies as may be needed. The Architect's approval of such drawings or schedules shall not relieve the Contractor from responsibility for deviations from drawings or specifications, unless he has in writing called the Architect's attention to such deviations at the time of submission, nor shall it relieve him from responsibility for errors of any sort in shop drawings or schedules.

*Art. 6.—Drawings and Specifications on the Work.*—The Contractor shall keep one copy of all drawings and specifications on the work, in good order.

available to the Architect and to his representatives.

*Art. 7. Ownership of Drawings and Models.*—All drawings, specifications and copies thereof furnished by the Architect are his property. They are not to be used on other work and, with the exception of the signed Contract set, are to be returned to him on request, at the completion of the work. All models are the property of the Owner.

*Art. 8. Samples.*—The Contractor shall furnish for approval all samples as directed. The work shall be in accordance with approved samples.

*Art. 9. Materials, Appliances, Employees.*—Unless otherwise stipulated, the Contractor shall provide and pay for all materials, labor, water, tools, equipment, light, power, transportation and other facilities necessary for the execution and completion of the work.

Unless otherwise specified, all materials shall be new, and both workmanship and materials shall be of good quality. The Contractor shall, if required, furnish satisfactory evidence as to the kind and quality of materials.

The Contractor shall at all times enforce strict discipline and good order among his employees, and shall not employ on the work any unfit person or any one not skilled in the work assigned to him.

*Art. 10. Royalties and Patents.*—The Contractor shall pay all royalties and license fees. He shall defend all suits or claims for infringement of any patent rights and shall save the Owner harmless from loss on account thereof, except that the Owner shall be responsible for all such loss when a particular process or the product of a particular manufacturer or manufacturers is specified, but if the Contractor has information that the process or article specified is an infringement of a patent he shall be responsible for such loss unless he promptly gives such information to the Architect or Owner.

*Art. 11. Surveys, Permits and Regulations.*—The owner shall make all surveys unless otherwise provided. Permits and licenses of a temporary nature necessary for the prosecution of the work shall be secured and paid for by the Contractor. Permits, licenses and easements for permanent structures or permanent changes in existing facilities shall be secured and paid for by the Owner.

The Contractor shall give all notices and comply with all laws, ordinances, rules and regulations bearing on the conduct of the work as drawn and specified. If the Contractor observes that the drawings and specifications are at variance therewith, he shall promptly notify the Architect in writing, and any neces-

sary changes shall be adjusted as provided in the Contract for changes in the work. If the Contractor performs any work knowing it to be contrary to such laws, ordinances, rules and regulations, and without such notice to the Architect, he shall bear all costs arising therefrom.

*Art. 12. Protection of Work and Property.*—The Contractor shall continuously maintain adequate protection of all his work from damage and shall protect the Owner's property from injury arising in connection with this Contract. He shall make good any such damage or injury, except such as may be directly due to errors in the Contract Documents or caused by agents or employees of the Owner. He shall adequately protect adjacent property as provided by law and the Contract Documents. He shall provide and maintain all passage ways, guard fences, lights and other facilities for protection required by public authority or local conditions.

In an emergency affecting the safety of life or of the work or of adjoining property, the Contractor, without special instruction or authorization from the Architect or Owner, is hereby permitted to act, at his discretion, to prevent such threatened loss or injury and he shall so act, without appeal, if so instructed or authorized. Any compensation claimed by the Contractor on account of emergency work, shall be determined by agreement or Arbitration.

*Art. 13. Inspection of Work.*—The Architect and his representatives shall at all times have access to the work wherever it is in preparation or progress and the Contractor shall provide proper facilities for such access and for inspection.

If the specifications, the Architect's instruction, laws, ordinances or any public authority require any work to be specially tested or approved, the Contractor shall give the Architect timely notice of its readiness for inspection, and if the inspection is by another authority than the Architect, of the date fixed for such inspection. Inspections by the Architect shall be promptly made, and where practicable at the source of supply. If any work should be covered up without approval or consent of the Architect, it must, if required by the Architect, be uncovered for examination at the Contractor's expense.

Re-examination of questioned work may be ordered by the Architect and if so ordered the work must be uncovered by the Contractor. If such work be found in accordance with the contract, the Owner shall pay the cost of re-examination and replacement. If such work be found not in accordance with the contract, the Contractor shall pay such cost, unless he shall show that the defect in the

### *A Plain Talk about A Plain Product*

**C**LAUSEN sells a plain product in an efficient, courteous manner.

Sewer pipe, flue lining, wall coping and other clay products are not objects to excite admiration.

But they are essential products, and while they lack beauty, they are sturdily made, conform to size and shape, and are as good as such articles should be.

Ample stocks for immediate delivery are always kept in our Philadelphia yard, and we can make same-day deliveries up to carlots.

All orders or inquiries receive prompt, courteous attention.

If you are not already buying from Clausen, give us the opportunity of serving you.

Architect taking bids due September 20th.

(Continued from page 596)

work was caused by another Contractor, and in that event the Owner shall pay such cost.

**Art. 14. Superintendence: Supervision.**—The Contractor shall keep on his work, during its progress, a competent superintendent and any necessary assistants, all satisfactory to the Architect. The superintendent shall not be changed except with the consent of the Architect, unless the superintendent proves to be unsatisfactory to the Contractor and ceases to be in his employ. The superintendent shall represent the Contractor in his absence and all directions given to him shall be as binding as if given to the Contractor. Important directions shall be confirmed in writing to the

Contractor. Other directions shall be so confirmed on written request in each case.

The Contractor shall give efficient supervision to the work, using his best skill and attention. He shall carefully study and compare all drawings, specifications and other instructions and shall at once report to the Architect any error, inconsistency or omission which he may discover.

**Art. 15. Changes in the Work.**—The Owner, without invalidating the Contract, may order extra work or make changes by altering, adding to or deducting from the work, the Contract Sum being adjusted accordingly. All such work shall be executed under the conditions of the original contract except that any claim for extension of time caused thereby shall be adjusted at the time of ordering such change.

In giving instructions, the Architect shall have authority to make minor changes in the work, not involving extra cost, and not inconsistent with the purposes of the building, but otherwise, except in an emergency endangering life or property, no extra work or change shall be made unless in pursuance of a written order from the owner, signed or countersigned by the Architect, or a written order from the Architect stating that the Owner has authorized the extra work or change, and no claim for an addition to the contract sum shall be valid unless so ordered.

The value of any such extra work or change shall be determined in one or more of the following ways:

- (a) By estimate and acceptance in a lump sum.
- (b) By unit prices named in the contract or subsequently agreed upon.
- (c) By cost and percentage or by cost and a fixed fee.

If none of the above methods are agreed upon, the Contractor, provided he receives an order as above, shall proceed with the work. In such case and also under case (c), he shall keep and present in such form as the Architect may direct, a correct account of the net cost of labor and materials, together with vouchers. In any case, the Architect shall certify to the amount due to the Contractor. Pending final determination of value, payments on account of changes shall be made on the Architect's certificate.

**Art. 16. Claims for Extra Cost.**—If the Contractor claims that any instructions by drawings or otherwise involve extra cost under this contract, he shall give the Architect written notice thereof within a reasonable time after the receipt of such instructions, and in any event before proceeding to execute the

work, except in emergency endangering life or property, and the procedure shall then be as provided for changes in the work. No such claim shall be valid unless so made.

**Art. 17. Deductions for Uncorrected Work.**—If the Architect and Owner deem it inexpedient to correct work injured or done not in accordance with the Contract, an equitable deduction from the contract price shall be made therefor.

**Art. 18. Delays and Extension of Time.**—If the Contractor be delayed in the completion of the work by any act or neglect of the Owner or the Architect, or of any employee of either, or by any other Contractor employed by the Owner, or by changes ordered in the work, or by strikes, lockouts, fire, unusual delay in transportation, unavoidable casualties or any causes beyond the Contractor's control, or by delay authorized by the Architect pending arbitration, or by any cause which the Architect shall decide to justify the delay, then the time of completion shall be extended for such reasonable time as the Architect may decide will compensate for such delay.

No such extension shall be made for delay occurring more than seven days before claim therefor is made in writing to the Architect. In the case of a continuing cause of delay, only one claim is necessary.

If no schedule or agreement stating the dates upon which drawings shall be furnished is made, then no claim for delay shall be allowed on account of failure to furnish drawings until two weeks after demand for such drawings and not then unless such claim be reasonable.

This article does not exclude the recovery of damages for delay by either party under other provisions in the contract documents.

**Art. 19. The Owner's Right to Do Work.**—If the Contractor should neglect to prosecute the work properly or fail to perform any provision of this contract, the Owner, after three days' written notice to the Contractor may, without prejudice to any other remedy he may have, make good such deficiencies and may deduct the cost thereof from the payment then or thereafter due the Contractor; provided, however, that the Architect shall approve both such action and the amount charged to the Contractor.

(Continued next week.)

The only road to advancement is to do your work so well that you are always ahead of the demands of your position. Our employers do not decide whether we shall stay where we are or go on and up; we decide that matter ourselves. Success or failure is not chosen for us: we choose them for ourselves.—H. W. Mabie.

## Changing an Attitude of Mind

It has been the tendency of the public to look upon insurance as something on which it must first be "sold" by convincing arguments of the insurance man.

That this attitude is undergoing a change is evidenced in the number of people who no longer wait for the agent to solicit their business but who seek out the agent and ask for insurance advice.

By its national advertising the Insurance Company of North America is helping materially to bring about that hoped for time when people will "consult their insurance agent as they consult their doctor or lawyer."

Represent North America.

**Means Heating Satisfaction**

The peculiar shape of the Bryant Tube is largely responsible for the greater efficiency obtained in an installation of

**BRYANT AUTOMATIC  
Hot Water  
STORAGE SYSTEMS**

This tube presents a greater heating surface to the flames and the thin walls quickly transmit the heat to the water. That is why Bryant Gas Boilers have been found 84½% efficient by scientific tests. Other desirable features are: Automatic control, low cost of operation, convenience, cleanliness, durability.

### STANDARD AGREEMENT FOR CONSTRUCTION OF BUILD- INGS

*Issued by the Joint Conference on Stand-  
ard Construction Contracts*

(Continued from last issue)

**Art. 20. Owner's Right to Terminate Contract.**—If the Contractor should be adjudged a bankrupt, or if he should make a general assignment for the benefit of his creditors, or if a receiver should be appointed on account of his insolvency, or if he should persistently or repeatedly refuse or should fail, except in cases for which extension of time is provided, to supply enough properly skilled workmen or proper materials, or if he should fail to make prompt payment to subcontractors or for material or labor, or persistently disregard laws, ordinances or the instructions of the Architect, or otherwise be guilty of a substantial violation of any provision of the contract, then the Owner, upon the certificate of the Architect that sufficient cause exists to justify such action, may without prejudice to any other right or remedy and after giving the Contractor seven days' written notice, terminate the employment of the Contractor and take possession of the premises and of all materials, tools and appliances thereon and finish the work by whatever method he may deem expedient. In such case the Contractor shall not be entitled to receive any fur-

ther payment until the work is finished. If the unpaid balance of the contract price shall exceed the expense of finishing the work, including compensation for additional managerial and administrative services, such excess shall be paid to the Contractor. If such expenses shall exceed such unpaid balance, the Contractor shall pay the difference to the Owner. The expense incurred by the Owner as herein provided, and the damage incurred through the Contractor's default, shall be certified by the Architect.

**Art. 21. Contractor's Right to Stop Work or Terminate Contract.**—If the work should be stopped under an order of any court, or other public authority, for a period of 3 months, through no act or fault of the Contractor or of any one employed by him, or if the Architect should fail to issue any certificate for payment within seven days after it is due, or if the Owner should fail to pay to the Contractor within seven days of its maturity and presentation, any sum certified by the Architect or awarded by arbitrators, then the Contractor may upon three days' written notice to the Owner and the Architect, stop work or terminate this contract and recover from the Owner payment for all work executed and any loss sustained upon any plant or materials and reasonable profit and damages.

**Art. 22. Correction of Work Before Final Payment.**—The Contractor shall

promptly remove from the premises all materials condemned by the Architect as failing to conform to the Contract, whether incorporated in the work or not, and the Contractor shall promptly replace and re-execute his own work in accordance with the Contract and without expense to the Owner and shall bear the expense of making good all work of other contractors destroyed or damaged by such removal or replacement.

If the Contractor does not remove such condemned work and materials within a reasonable time, fixed by written notice, the Owner may remove them and may store the material at the expense of the Contractor. If the Contractor does not pay the expense of such removal within a reasonable time thereafter, the Owner may, upon ten days' written notice, sell such materials at auction or at private sale and shall account for the net proceeds thereof, after deducting all the costs and expenses that should have been borne by the Contractor.

**Art. 23. Correction of Work After Final Payment.**—Neither the final certificates nor payment nor any provision in the Contract Documents shall relieve the Contractor of responsibility for faulty materials or workmanship and he shall remedy any defects due thereto and pay for any damage to other work resulting therefrom, which shall appear within a period of two years from the time of installation. The Owner shall

give notice of observed defects with reasonable promptness. All questions arising under this article shall be decided by the Architect subject to arbitration.

*Art. 24. Applications for Payments.*—The Contractor shall submit to the Architect an application for each payment, and, if required, receipts or other vouchers, showing his payments for materials and labor, including payments to subcontractors as required by Art. 37.

If payments are made on valuation of work done, such application shall be submitted at least 10 days before each payment falls due, and, if required, the Contractor shall, before the first application, submit to the Architect a schedule of values of the various parts of the work, including quantities, aggregating the total sum of the contract, divided so as to facilitate payments to subcontractors in accordance with Article 37 (e), made out in such form as the Architect and the Contractor may agree upon, and, if required, supported by such evidence as to its correctness as the Architect may direct. This schedule, when approved by the Architect, shall be used as a basis for certificates of payment, unless it be found to be in error. In applying for payments the contractor shall submit a statement based upon this schedule, and, if required, itemized in such form and supported by such evidence as the Architect may direct, showing his right to the payment claimed.

*Art 25. Certificates of Payments.*—If the Contractor has made application as above, the Architect shall, not later than the date when each payment falls due, issue to the Contractor a certificate for such amount as he decides to be properly due.

No certificate issued nor payment made to the Contractor, nor partial or entire use or occupancy of the work by the Owner shall be an acceptance of any work or materials not in accordance with this contract. The making and acceptance of the final payment shall constitute a waiver of all claims

by the Owner, other than those arising from unsettled liens, from faulty work appearing after final payment or from requirement of the specifications, and of all claims by the Contractor, except those previously made and still unsettled.

*Art. 26. Payments Withheld.*—The Architect may without or, on account of subsequently discovered evidence, nullify the whole or a part of any certificate to such extent as may be necessary to protect the Owner from loss on account of:

- (a) Defective work not remedied.
- (b) Claims filed or reasonable evidence indicating probable filing of claims.
- (c) Failure of the Contractor to make payments properly to subcontractors or for material or labor.
- (d) A reasonable doubt that the contract can be completed for the balance then unpaid.
- (e) Damage to another Contractor.

When the above grounds are removed payment shall be made for amounts withheld because of them.

*Art. 27. Contractor's Liability Insurance.*—The Contractor shall maintain such insurance as will protect him from claims under workmen's compensation acts and from any other claims for damages for personal injury, including death, and damage to property, which may arise from operations under this Contract, whether such operations be by himself or by any sub-contractor, or anyone directly or indirectly employed by either of them. Certificates of such insurance shall be filed with the Owner, if he so require, and shall be subject to his approval for adequacy of protection.

*Art. 28. Owner's Liability Insurance.*—The Owner shall be responsible for and at his option may maintain such insurance as will protect him from his contingent liability for damages for personal injury, including death, which

*Propper Silk Hosiery Mill, Elmhurst, L. I.  
Heated by No. 15-40 Novelty Carburetor Steam Boiler.*

## *Past Experience Selected the Boiler for this Factory*

The Propper Silk Hosiery Mill is situated in an exposed position with all four walls principally of glass. It presented a real heating problem.

However, the Heating Engineer had had ample opportunity to know what the Novelty Carburetor Boiler will do. His experience with 2 No. 10-40 and 1 No. 9-40 Novelty Carburetor Boilers in the new Park Avenue Baptist Church (the "Rockefeller" Church), together with his knowledge of what 3 No. 13-40 Novelty Carburetor Boilers had accomplished for him in the Title Guarantee & Trust Company, Jamaica, Long Island, was his assurance that all heating requirements would be adequately met by again specifying a

A side-feed, sectional boiler, the Novelty is admirably adapted to large buildings. The Carburetor Chambers (one to each section) on the rear of the boiler, automatically mix all smoke, soot and carbon with oxygen from the air and burn them. The air enters top and bottom slots in the rear of each carburetor, as shown in the picture. No adjustment of air intake is necessary. Rate of combustion determines amount of air required.

## Proposal

TREASURY DEPARTMENT, Supervising Architect's Office, Washington, D. C., Sept. 19, 1924—Sealed Proposals will be opened in this office at 3 P. M., Oct. 16, 1924, for New Water Pumps, etc., U. S. Quarantine Station, Reedy Island, Del. Drawing and specifications may be obtained from this office or at the office of the Custodian, U. S. Quarantine Station, Reedy Island, Del., in the discretion of the Supervising Architect. Jas. A. Wetmore, Acting Supervising Architect.

(Continued from Page 612)

may arise from operations under this contract.

**Art. 29. Fire Insurance.**—The Owner shall effect and maintain fire insurance upon the entire structure on which the work of this contract is to be done and upon all materials in or adjacent thereto and intended for use thereon, to at least eighty per cent. of the insurable value thereof. The loss, if any, is to be made adjustable with and payable to the Owner as Trustee for whom it may concern.

All policies shall be open to inspection by the Contractor. If the Owner

fails to show them on request, or if he fails to effect or maintain insurance as above, the Contractor may insure his own interest and charge the cost thereof to the Owner. If the Contractor is damaged by failure of the Owner to maintain such insurance, he may recover as stipulated in the contract for recovery of damages.

If required in writing by any party in interest, the Owner as Trustee shall, upon the occurrence of loss, give bond for the proper performance of his duties. He shall deposit any money received from insurance in an account separate from all his other funds and he shall distribute it in accordance with such agreement as the parties in interest may reach, or under an award of arbitrators appointed, one by the Owner, another by joint action of the other parties in interest, all other procedure being as provided elsewhere in the contract for Arbitration. If after loss no special agreement is made, replacement of injured work shall be ordered and executed as provided for changes in the work.

The Trustee shall have power to adjust and settle any loss with the insurers unless one of the Contractors interested shall object in writing within three working days of the occurrence of loss, and thereupon arbitrators shall be chosen as above. The Trustees shall in that case make settlement with the insurers in accordance with the directions of such arbitrators, who shall also, if distribution by arbitration is required, direct such distribution.

**Art. 30. Guaranty Bonds.**—The Owner shall have the right to require the Contractor to furnish bond covering the faithful performance of the contract and the payment of all obligations arising thereunder, in such form as the Owner may prescribe and with such sureties as he may approve. If such bond is required by instructions given previous to the receipt of bids, the premium shall be paid by the Contractor; if subsequent thereto, it shall be paid by the Owner.

**Art. 31. Damages.**—Any claim for damage arising under this contract shall be made in writing to the party liable within a reasonable time of the first observance of such damage and not later than the time of final payment, except as expressly stipulated otherwise in the case of faulty work or materials, and shall be adjusted by agreement or arbitration.

**Art. 32. Liens.**—Neither the final payment nor any part of the retained percentage shall become due until the Contractor, if required, shall deliver to the owner a complete release of all liens arising out of this Contract, or receipts

in full in lieu thereof and, if required in either case, an affidavit that so far as he has knowledge or information the releases and receipts include all the labor and material for which a lien could be filed; but the Contractor may, if any subcontractor refuses to furnish a release or receipt in full, furnish a bond satisfactory to the Owner, to indemnify him against any lien. If any lien remain unsatisfied after all payments are made, the Contractor shall refund to the Owner all moneys that the latter may be compelled to pay in discharging such a lien, including all costs and a reasonable attorney's fee.

**Art. 33. Assignment.**—Neither party to the Contract shall assign the Contract or sublet it as a whole without written consent of the other, nor shall the Contractor assign any moneys due or to become due to him hereunder, without the previous written consent of the owner.

**Art. 34. Mutual Responsibility of Contractors.**—Should the Contractor cause damage to any other contractor on the work, the Contractor agrees upon due notice, to settle with such contractor by agreement or arbitration if he will so settle. If such other contractor sues the Owner on account of any damage alleged to have been so sustained, the Owner shall notify the Contractor, who shall defend such proceedings at the Owner's expense and, if any judgment against the Owner arise therefrom, the Contractor shall pay or satisfy it and pay all costs incurred by the Owner.

**Art. 35. Separate Contracts.**—The Owner reserves the right to let other contracts in connection with this work. The Contractor shall afford other contractors reasonable opportunity for the introduction and storage of their materials and the execution of their work and shall properly connect and co-ordinate his work with theirs.

If any part of the Contractor's work depends for proper execution or results upon the work of any other contractor, the Contractor shall inspect and promptly report to the Architect any defects in such work that render it unsuitable for such proper execution and results. His failure so to inspect and report shall constitute an acceptance of the other contractor's work as fit and proper for the reception of his work, except as to defects which may develop in the other contractor's work after the execution of his work.

To insure the proper execution of his subsequent work the Contractor shall measure work already in place and shall at once report to the Architect any discrepancy between the executed work and the drawings.

## Changing an Attitude of Mind

It has been the tendency of the public to look upon insurance as something on which it must first be "sold" by convincing arguments of the insurance man.

That this attitude is undergoing a change is evidenced in the number of people who no longer wait for the agent to solicit their business but who seek out the agent and ask for insurance advice.

By its national advertising the Insurance Company of North America is helping materially to bring about that hoped for time when people will "consult their insurance agent as they consult their doctor or lawyer."

Represent North America.

## Insurance Company of North America

PHILADELPHIA

*Indemnity Insurance Company of North America write practically every form of insurance except life*

## For Permanently Hard and Waterproof Concrete

THE addition of "ANTI-HYDRO," a liquid integral compound, to the gauging water produces extremely hard and absolutely waterproof concrete all in **one operation.**

For waterproofing concrete cellars, walls, foundations, pits, stucco, mortar, etc., "ANTI-HYDRO" has no equal. It is easy and economical to use—simply mix it with the gauging water.

For 20 years "ANTI-HYDRO" has given complete satisfaction on every type of concrete hardening and waterproofing work.

## As The Editor Sees It

### STANDARD AGREEMENT FOR CONSTRUCTION OF BUILD- INGS

*Issued by the Joint Conference on Stand-  
ard Construction Contracts*

(Continued from last issue)

**Art. 36.—Subcontracts.**—The Contractor shall, as soon as practicable after the signature of the contract, notify the Architect in writing of the names of subcontractors proposed for the principal parts of the work and for such others as the Architect may direct and shall not employ any that the Architect may within a reasonable time object to as incompetent or unfit.

If the Contractor has submitted before signing the contract a list of sub-contractors and the change of any name on such list is required or permitted after signature of agreement, the contract price shall be increased or diminished by the difference in cost occasioned by such change.

The Architect shall, on request, furnish to any subcontractor, wherever practicable, evidence of the amounts certified on his account.

The Contractor agrees that he is, as fully responsible to the Owner for the acts and omissions of his subcontractors and of persons either directly or indirectly employed by them, as he is for the acts and omissions of persons directly employed by him.

Nothing contained in the contract doc-

uments shall create any contractual relation between any subcontractor and the Owner.

**Art. 37. Relations of Contractor and Subcontractor.**—The Contractor agrees to bind every Subcontractor and every Subcontractor agrees to be bound by the terms of the Agreement, the General Conditions, the Drawings and Specifications as far as applicable to his work, including the following provisions of this article, unless specifically noted to the contrary in a subcontract approved in writing as adequate by the Owner or Architect.

This does not apply to minor subcontracts.

The Contractor shall provide also in each contract, except as noted above, that the Subcontractor agrees—

(a) To be bound to the Contractor by the terms of the Agreement, General Conditions, Drawings and Specifications, and to assume toward him all the obligations and responsibilities that he, by those documents, assumes toward the Owner.

(b) To submit to the Contractor applications for payment in such reasonable time as to enable the Contractor to apply for payment under Article 24 of the General Conditions.

(c) To make all claims for extras, for extensions of time and for damages for delays or otherwise, to the Contractor in the manner provided in the Agreement for like claims by the Contractor upon

the Owner, except that the time for making claims for extra cost is one week.

The Contractor agrees—

(d) To be bound to the Subcontractor by all the obligations that the Owner assumes to the Contractor under the Agreement, General Conditions, Drawings and Specifications, and by all the provisions thereof affording remedies and redress to the Contractor from the Owner.

(e) To pay the Subcontractor, upon the issuance of certificates, if issued under the schedule of values described in Article 24 of the General Conditions, the amount allowed to the Contractor on account of the Subcontractor's work to the extent of the Subcontractor's interest therein.

(f) To pay the Subcontractor, upon the issuance of certificates, if issued otherwise than as in (e), so that at all times his total payments shall be as large in proportion to the value of the work done by him as the total amount certified to the Contractor is to the value of the work done by him.

(g) To pay the Subcontractor to such extent as may be provided by the Contract Documents or the subcontract, if either of these provides for earlier or larger payments than the above.

(h) To pay the Subcontractor on demand for his work or materials as far as executed and fixed in place, less the retained percentage, at the time the certificate should issue, even though the

**BLUE  
PRINTS**

Architect fails to issue it for any cause not the fault of the Subcontractor.

(j) To pay the Subcontractor a just share of any fire insurance money received by him, the Contractor, under Article 29 of the General Conditions.

(k) To make no demand for liquidated damages or penalty for delay in any sum in excess of such amount as may be specifically named in the subcontract.

(l) That no claim for services rendered or materials furnished by the Contractor to the Subcontractor shall be valid unless written notice thereof is given by the Contractor to the Subcontractor during the first ten days of the calendar month following that in which the claims originated.

(m) To give the Subcontractor an opportunity to be present and to submit evidence in any arbitration involving his rights.

(n) To name as arbitrator under arbitration proceedings as provided in the Agreement, the person nominated by the Subcontractor, if the sole cause of dispute is the work, materials, rights or responsibilities of the Subcontractor; or, if the Subcontractor and any other subcontractor jointly, to name as such arbitrator the person upon whom they agree.

The Contractor and the Subcontractor agree that—

(o) In the matter of arbitration, their rights and obligations and all procedure shall be analogous to those set forth in this contract.

Nothing in this article shall create any obligation on the part of the Owner to pay to or to see to the payment of any sums to any Subcontractor.

**Art. 38. Cash Allowances.**—The Contractor shall include in the contract sum all allowances named in the Contract Documents and shall cause the work so covered to be done by such Contractor and for such sums as the Architect may direct, the contract sum being adjusted in conformity therewith. The Contractor declares that the contract sum includes such sums for expenses and profit on account of cash allowances as he deems proper. No demand for expenses or profit other than those included in the contract sum shall be allowed. The contractor shall not be required to employ for any such work persons against whom he has a reasonable objection.

**Art. 39. Architect's Status.**—The Architect shall have general supervision and direction of the work. He is the agent of the Owner only to the extent provided in the Contract Documents and when in special instances he is authorized by the Owner so to act, and in such instances he shall, upon request, show the Contractor written authority. He has authority to stop the work whenever such stoppage may be neces-

sary to insure the proper execution of the Contract.

As the Architect is, in the first instance, the interpreter of the conditions of the Contract and the judge of its performance, he shall side neither with the Owner nor with the Contractor, but shall use his powers under the contract to enforce its faithful performance by both.

In case of the termination of the employment of the Architect, the Owner shall appoint a capable and reputable Architect, whose status under the contract shall be that of the former Architect.

**Art. 40. Architect's Decisions.**—The Architect shall, within a reasonable time, make decisions on all claims of the Owner or Contractor and on all other matters relating to the execution and progress of the work or the interpretation of the Contract Documents.

All such decisions of the Architect shall be final except as to the element of time and the financial considerations involved, which, if no agreement in regard thereto is reached, shall be subject to arbitration.

**Art. 41. Arbitration.**—All questions subject to arbitration under this contract shall be submitted to arbitration at the choice of either party to the dispute.

The Contractor shall not cause a delay of the work during any arbitration proceedings, except by agreement with the Owner.

The demand for arbitration shall be filed in writing with the Architect, in the case of an appeal from his decision, within ten days of its receipt and in any other case within a reasonable time after cause thereof and in no case later than the time of final payment, except as otherwise expressly stipulated in the Contract. If the Architect fails to make a decision within a reasonable time, an appeal to arbitration may be taken as if his decision had been rendered against the party appealing.

No one shall be nominated or act as an arbitrator who is in any way financially interested in this Contract or in the business affairs of either the Owner, Contractor or Architect.

The general procedure shall conform to the laws of the State in which the work is to be erected. Unless otherwise provided by such laws, the parties may agree upon one arbitrator, otherwise there shall be three, one named in writing, by each party to this Contract, to the other party and to the Architect and the third chosen by these two arbitrators, or if they fail to select a third within the ten days, then he shall be chosen by the presiding officer of the Bar Association nearest to the location of the work. Should the party demanding arbitration fail to

## Proposal

TREASURY DEPARTMENT, Office of the Supervising Architect, Washington, D. C., September 22, 1924. SEALED PROPOSALS will be opened in this office at 3 P. M., October 13th, 1924, for repairs to wharf at the United States Quarantine Station, Marcus Hook, Pa. Specifications may be obtained from the Custodian or at this office, in the discretion of the Supervising Architect. Jas. A. Wetmore, Acting Supervising Architect.

(Continued from Page 628)

name an arbitrator within 15 days of his demand, his right to arbitration shall lapse. Should the other party fail to choose an arbitrator within said 15 days, then such presiding officer shall appoint such arbitrator. Should either party refuse or neglect to supply the arbitrators with any papers or information demanded in writing, the arbitrators are empowered by both parties to proceed exparte.

If there be one arbitrator his decision shall be binding; if three the decision of any two shall be binding. Such decisions shall be a condition precedent to any right of legal action, and whenever permitted by law it may be filed in Court to carry it into effect.

The arbitrators, if they deem that the case demands it, are authorized to award to the party whose contention is sustained, such sums as they shall deem proper for the time, expense and trouble incident to the appeal and, if the appeal was taken without reasonable cause, damages for delay. The arbitrators shall fix their own compensation, unless otherwise provided by agreement, and shall assess the costs and charges of the arbitration upon either or both parties.

The award of the arbitrators must be in writing and, it shall not be open to objection on account of the form of the proceeding or the award, unless otherwise provided by the laws of the State in which the work is to be done.

In the event of such laws providing on any matter covered by this article otherwise than as hereinbefore specified, the method of procedure throughout and the legal effect of the award shall be wholly in accordance with the said State laws, it being intended hereby to lay down a principle of action to be followed, leaving its local application to be adapted to the legal requirements of the place in which the work is done.

*Art. 42. Use of Premises.*—The Contractor shall confine his apparatus, the storage of materials and the operations of his workmen to limits indicated by law, ordinances, permits or directions of the Architect, and shall not unreasonably encumber the premises with his materials.

The Contractor shall not load or permit any part of the structure to be loaded with a weight that will endanger its safety.

The Contractor shall enforce the Architect's instructions regarding signs, advertisements, fires and smoking.

*Art. 43. Cutting, Patching and Digging.*—The Contractor shall do all cutting, fitting or patching of his work that may be required to make its several parts come together properly and fit it to receive or be received by work of other contractors shown upon, or reasonably implied by, the Drawings and Specifications for the completed structure, and he shall make good after them as the Architect may direct.

Any cost caused by defective or ill-timed work shall be borne by the party responsible therefor.

The Contractor shall not endanger any work by cutting, digging or otherwise, and shall not cut or alter the work of any other contractor save with the consent of the Architect.

*Art. 44. Cleaning Up.*—The Contractor shall at all times keep the premises free from accumulations of waste material or rubbish caused by his employes or work, and at the completion of the work he shall remove all his rubbish from and about the building and all his tools, scaffolding and surplus materials and shall leave his work "broom clean" or its equivalent, unless more exactly specified. In case of dispute the Owner may remove the rubbish and charge the cost to the several contractors as the Architect shall determine to be just.

## BUDGETING FOR THE CONTRACTING AND CONSTRUCTION COMPANY

*Prepared by Policyholders' Service Bureau, Group Insurance Division, Metropolitan Life Insurance Company, 1 Madison Ave., New York*

### Construction Can Be Budgeted

**A**DMITTING the difficulties of forecasting conditions in the construction business, it is a fact that a number of representative construction companies are now operating on a budget basis. The following is a short description of the practice and experience of one large construction company:

"At the first of the year, we make up a carefully studied budget for the entire year. Of course, the budget must vary with the volume of business transacted, which cannot be known at that time and we, therefore, correct or budget by a quarterly revision.

"We are satisfied that the results have been beneficial—first, we have before us a close estimate of the probable cost of operation for the year to guide us in our business management; and second, the monthly review of this budget in comparison with the actual expenses serves to keep our cost of doing business at the lowest practical amount."

#### *Requisites of a Budget System for a Construction Company*

Budgeting for construction revolves about three elements:

1. Anticipation of Cash Requirements.
2. Forecasting of overhead expenses.
3. Use of the estimate.

#### *Anticipation of Cash Requirements.*

The anticipation of cash requirements is not very difficult for the contractor. He knows at the beginning of each month, on the basis of work performed, what he can expect in the way of payments upon contracts. He knows his cash balances. His voucher register gives him the story of bills to be paid. He knows with a fair degree of accuracy what his outlays for office and executive salaries and wages will be. He knows the extent of his fixed expenses. He has a fair idea of the jobs under way and the

extent of the labor force necessary to carry on operations. A comparison of necessary expenditures and estimated cash resources will give him a line on his bank loan requirements.

On the general subject of anticipating cash requirements contractors have this to say:

- (a) "We do anticipate our financial requirements at the beginning of the year and arrive at an interest charge which is part of our fixed overhead cost."
- (b) "We arrange for a line of credit with our bank which is subject to increases according to the amount of building contracts which we secure."
- (c) "We do anticipate our financial requirements. We, however, do most all of our work on a cost plus fixed fee basis and our financing is largely done by the owners who advance money in order to take advantage of discounts; while when we use our own money we keep the discounts as our commission for the use of funds. In this way we have not been obliged to make bank loans for a good many years."

Commenting on the foregoing, there is considerable doubt in the minds of some of the Construction and Contracting Companies whether interest should be included in the overhead cost.

For those companies not so fortunately situated the following form for anticipating cash requirements will be of interest.

### Semi-Monthly Financial Forecast

Estimated Receipts				
Cash				
On Hand				
In Banks				
Due from Customers				
Miscellaneous				
Total Cash Resources				
Estimated Expenditures				
Bills to be paid during month				
Payroll and Expenses				
Loans from Banks

## Changing an Attitude of Mind

It has been the tendency of the public to look upon insurance as something on which it must first be "sold" by convincing arguments of the insurance man.

That this attitude is undergoing a change is evidenced in the number of people who no longer wait for the agent to solicit their business but who seek out the agent and ask for insurance advice.

By its national advertising the Insurance Company of North America is helping materially to bring about that hoped for time when people will "consult their insurance agent as they consult their doctor or lawyer."

Represent North America.

**LINOTILE  
FLOORS****Have Character**

Unusually effective designs are obtained with Armstrong's Linotile Flooring. As its name indicates Linotile is tile made and laid in separate units, and not being supplied in sheets or in set patterns is capable of wide expression in design.

But aside from the effective designs, Linotile is

Resilient  
Non-slippery  
Silent underfoot  
Warm  
Sanitary

Easy to clean  
Odorless  
Artistic  
Durable  
Reasonable in cost

We shall be glad to give you full details of the wonderful possibilities of Linotile as a flooring for residences, banks, offices, public buildings, etc.

Drexel Bldg., Philadelphia,  
Pa.; Owners, Fox Bros., Phil-  
adelphia, Pa.

## The Natural Selection for Heating these Apartments

Hundreds of apartment houses, similar to the Queens Court Apartments of Philadelphia, are built throughout the large cities of the United States.

The architect, in making the design, naturally takes into consideration how deep he must go in excavating for the basement. Each extra inch saved in depth saves considerable money for his client.

Every square foot of space in the basement is valuable, so the more the architect saves from the space required for the heating system, the more money is placed in the pocket of the owner.

The Novelty Carburetor Boiler with its

low water line of fifty inches saves several inches in excavation. The small amount of space required for firing the boiler on account of its side-feed construction reduces the amount of space needed for the heating system itself and allows more space for other use.

The fact that the Novelty Carburetor Boiler burns all kinds of fuel, including soft coal, the smaller sizes of hard coal, and oil, immediately solves the fuel problem, which is one of utmost importance today.

In view of these facts, the Novelty Carburetor Boiler installed in the Queens Court Apartments was a natural selection.

*Write for illustrated and descriptive booklet giving worth-while facts about space-saving, low water line of 50", long life and fuel saving.*

## Proposal

### ADVERTISEMENT FOR THE CONSTRUCTION OF BUILDINGS FOR THE NEW JERSEY SCHOOL FOR THE DEAF.

Public notice is hereby given that sealed proposals for furnishing labor and materials to construct and equip ready for furnishing the New School Building, including Dining Hall, Kitchen, Auditorium, Gymnasium and Locker Rooms, Shop Building, Laundry Building, and Superintendent's House as shown on the Plot Plan of the grounds of the New Jersey School for the Deaf, near Trenton Junction, New Jersey, will be received and opened by the Architects at the State House, in Trenton, New Jersey, on the 23rd day of October, 1924, at 2.30 o'clock P. M.

Bids will be received as follows for the general construction of all buildings above mentioned. Bids will likewise be received separately for the General Construction of:

(1) The New School Building, including Dining Hall, Kitchen, Auditorium and Gymnasium and Locker Rooms, Shop Building.

(2) For the General Construction of Laundry Building.

(3) For the General Construction of the Superintendent's House.

Each bid must be accompanied with unit prices on the following items for use in estimating additional work or deductions from contract requirements and in adjusting monthly payments: Excavation per cu. yd., Rock Excavation, Mass Concrete per cu. yd., Reinforced Concrete per cu. yd., Cement basement floors per sq. ft., Forms for concrete per sq. ft., Structural Steel per ton, Brickwork per thousand, Face and Common, Roofs per square, Plaster per sq. yd.

**CHAPMAN SLATE CO.**  
BETHLEHEM, PA.  
**ROOFING SLATE EXCLUSIVELY**  
The Only Manufacturers of Genuine Chapman Slate

Separate bids will also be received for the following:

(4) For Plumbing Water Supply and Drainage for all the buildings as above mentioned, also for each separate group or building as mentioned above.

(5) For Heating and Ventilating for all the buildings as above mentioned, also for each separate group or building as mentioned above.

(6) For Electrical Work for all the buildings as above mentioned, also for each separate group or building as mentioned above.

The right is reserved to accept or reject any or all bids or to waive any informality in any bids presented. All bids must be in sealed envelopes endorsed "Proposals for New Jersey School for the Deaf," and stating the branch of work estimated upon.

No bids will be considered unless accompanied by a certified check to the order of the State of New Jersey, in the amount of five per cent. of the bid, binding the bidder to execute a contract and bond if awarded to him. The terms of proposal with surety required are fixed by the specifications.

Copies of the drawings and specifications will be on file at the office of the Architects for the purpose of estimating. A limited number of the copies of the plans and specifications will be loaned by the Architects to prospective bidders on deposit of a certified check to their order in the sum of FIFTY (\$50.00) DOLLARS. These drawings and specifications may be obtained by application to Arnold H. Moses, Architect, Temple Building, Camden, N. J. If the drawings and specifications are returned to the Architects and an estimate submitted the check will be returned, otherwise the deposit may become forfeited.

ARNOLD H. MOSES,  
GUILBERT & BETELLE,  
Associated Architects.

Dated October 2nd, 1924.

#### Statement of the Ownership, Management, Circulation, etc.

Statement of the ownership, management, circulation, etc., of The Builders' Guide, published weekly at Philadelphia, Pa., required by the Act of August 24, 1912, or April 1, 1924.

Editor, H. L. Sharpe.

Managing Editor, none.

Business Manager, Louis S. DeLone.

Publishers, Building News Publishing Co., Perry Building, Philadelphia.

Owners, Louis S. DeLone, Perry Building, Philadelphia; Samuel R. McDowell, Narberth, Pa.

Known bondholders, mortgages and other security holders holding one per cent. or more of total amount of bonds, mortgages or other securities, none.

(Signed)

Building News Publishing Co.,  
Louis S. DeLone, Business Manager.

Sworn and subscribed before me this 17th day of September, 1924.

Edward J. Toole, Notary Public.

(My commission expires January 21, 1925.)

An old legend tells of a magician's vase; the magician could get out of it only that which he put in. Advertising is just that. If you don't get into it the "kick" of salesmanship it is going to miss by just that much the pulling power it ought to have.

## BUDGETING FOR THE CONTRACTING AND CONSTRUCTION COMPANY

*Prepared by Policyholders' Service  
Bureau, Group Insurance Division,  
Metropolitan Life Insurance  
Company, 1 Madison Ave.,  
New York*

### *Construction Can Be Budgeted*

(Continued from last issue)

The Financial Forecast is made semi-monthly. Whereas the Contractor can depend on certain payments between the 1st and 15th of the month, there are always some customers who drag over to the 18th or 20th. This lag is taken care of either through bank loans or by withholding payment to some of the large subcontractors for a few days.

### *Forecasting of Overhead Expenses*

A second construction company follows substantially the same procedure relative to the general overhead:

"At the beginning of the year we estimate the total overhead expense for the ensuing year, based on the expense of the preceding years and we also estimate the volume of business which we can expect to accomplish with our organization, taking into account business conditions."

The general overhead expense receives too scant attention from many contractors. It is merged frequently in the profit fee, the size of which one contractor admits is determined largely by "How badly off the organization is for work." For a contractor doing a business of from \$500,000 to \$1,000,000 it is estimated that his overhead charges will amount to approximately \$30,000 for his own salary and the salaries of the manager, estimator, accountant, bookkeeper and stenographer, together with charges for rent, light, stationery, telephone, rent of storage yard and tool expense. This is too large an item to be ignored. It should be clearly kept in mind when estimating on jobs.

The contract of a large construction company provides that no part of the expense to the contractor of maintaining the departments named below shall be charged to the cost of work:

Executive Department  
Contract Department  
Budget Department  
Estimating Department  
Accounting Department  
Auditing Department

All of the foregoing items are included in the category of general overhead, which in this instance, in line with the procedure of other construction companies, must be taken from out the contractor's fee. Few parallel situations exist in other industries. General overhead is

a recognized cost of doing business and should be provided for independently in the estimates of the contractor.

There are two kinds of overhead attendant upon construction—first, job overhead which includes a subdivision covering equipment charges; and second, the general overhead. The general overhead expense of a typical construction company includes the following items:

### *General Overhead*

- (a) Executive.
- (b) General office salaries, which is sub-divided into service, purchasing, estimating, bookkeeping, auditing, cost accounting, and employment.
- (c) Light, heat and rent.
- (d) Office supplies.
- (e) Office miscellaneous expenses including legal, dues, gifts at Christmas, telephone, library, travel, auditing, etc.
- (f) Engineering Department, in which considerable designing is carried on, and which department is charged with its proportion of light, heat and rent, telephone, and miscellaneous service.
- (g) Unused labor—A number of field men are so valuable that they cannot be spared. These are paid wages between jobs.
- (h) Advertising.
- (i) Selling.
- (j) Taxes—local and federal.
- (k) Repairs—maintenance of guarantees on work.
- (l) Storage yard—This is a store yard for large tools and equipment between jobs at which place such equipment is overhauled and repaired as necessary.

Items shown under f, g, and l are open to question as proper general overhead items. This is a matter of judgment to be decided by the individual Contractor and Construction Company.

In order to maintain control, the foregoing items are carefully estimated at the beginning of the year and the actual expense of the year is compared directly with such estimates, by months in amounts and graphically.

(Continued next week.)

When you stop to consider that the Guide reaches every week and is read by architects, builders, building owners, contractors and sub-bidders in every branch of building construction, you must perceive its unique importance as a medium for advertising with an appeal to that class. Every copy reaches a live prospect.

## Changing an Attitude of Mind

It has been the tendency of the public to look upon insurance as something on which it must first be "sold" by convincing arguments of the insurance man.

That this attitude is undergoing a change is evidenced in the number of people who no longer wait for the agent to solicit their business but who seek out the agent and ask for insurance advice.

By its national advertising the Insurance Company of North America is helping materially to bring about that hoped for time when people will "consult their insurance agent as they consult their doctor or lawyer."

Represent North America.

## For Permanently Hard and Waterproof Concrete

THE addition of "ANTI-HYDRO," a liquid integral compound, to the gauging water produces extremely hard and absolutely waterproof concrete all in **one operation.**

For waterproofing concrete cellars, walls, foundations, pits, stucco, mortar, etc., "ANTI-HYDRO" has no equal. It is easy and economical to use—simply mix it with the gauging water.

For 20 years "ANTI-HYDRO" has given complete satisfaction on every type of concrete hardening and waterproofing work.

### BUDGETING FOR THE CON- TRACTING AND CONSTRUC- TION COMPANY

Prepared by Policyholders' Service  
Bureau, Group Insurance Division,  
Metropolitan Life Insurance  
Company, 1 Madison Ave.,  
New York

*Construction Can Be Budgeted*  
(Continued from last issue)

At the risk of some repetition, the  
items of general overhead suggested by  
the Association of General Contractors  
are set down in budget form on this page:

#### *Job Overhead*

Job overhead includes those items of  
expense which are traceable to a specific  
undertaking but cannot be allocated to  
any specific phase or operation of that  
undertaking. It is essential that a con-  
tractor shall have a complete understand-  
ing of all the items entering into such job  
overhead, and that each specific job fully  
absorb such expenses. It makes for sim-  
plicity when such job overhead expenses  
are provided for by the contractor at a  
definite percentage of direct material and  
labor cost of the project.

For example, one large construction com-  
pany sets this job overhead at 4 to 6% of  
direct cost, such percentage incidentally  
including the rental cost of equipment.  
When a definite percentage of direct la-

### Budget of General Overhead

**BLUE  
PRINTS**

bor and material is set aside for job overhead, such percentage in effect becomes a budget of the contractor. It is up to the organization to keep the job overhead within such limits. Any excess above the 4% to 6% mean a loss on the job overhead expense.

Before reproducing the items included in the job overhead by the Associated General Contractors and the table of equipment charges of that organization, it is worth while to note specifically the items covered by the aforementioned 4% to 6% as follows:

The hire, use and transportation to and from the site, the repair, de-

preciation and destruction or loss of such construction plant and equipment as is called for in the Equipment Schedule, as well as the services and travelling and other expenses of officers and employees in the Construction, Supervising, Structural and Mechanical Engineering, Draughting, Traffic, Inspection and Expediting, and Cost Departments.

#### *Use of the Estimate*

What is said here relative to the use of the estimate in budgeting has a wide application. It holds true for any engineering project; in fact for any jobbing industry.

### Form 3--Job Overhead Summary

Class of Expense	Amount

## Proposal

### ADVERTISEMENT FOR THE CONSTRUCTION OF BUILDINGS FOR THE NEW JERSEY SCHOOL FOR THE DEAF.

Public notice is hereby given that sealed proposals for furnishing labor and materials to construct and equip ready for furnishing the New School Building, including Dining Hall, Kitchen, Auditorium, Gymnasium and Locker Rooms, Shop Building, Laundry Building, and Superintendent's House as shown on the Plot Plan of the grounds of the New Jersey School for the Deaf, near Trenton Junction, New Jersey, will be received and opened by the Architects at the State House, in Trenton, New Jersey, on the 23rd day of October, 1924, at 2.30 o'clock P. M.

Bids will be received as follows for the general construction of all buildings above mentioned. Bids will likewise be received separately for the General Construction of:

(1) The New School Building, including Dining Hall, Kitchen, Auditorium and Gymnasium and Locker Rooms, Shop Building.

(2) For the General Construction of Laundry Building.

(3) For the General Construction of the Superintendent's House.

Each bid must be accompanied with unit prices on the following items for use in estimating additional work or deductions from contract requirements and in adjusting monthly payments: Excavation per cu. yd., Rock Excavation, Mass Concrete per cu. yd.,

Reinforced Concrete per cu. yd., Cement basement floors per sq. ft., Forms for concrete per sq. ft., Structural Steel per ton, Brickwork per thousand, Face and Common, Roofs per square, Plaster per sq. yd.

Separate bids will also be received for the following:

(4) For Plumbing Water Supply and Drainage for all the buildings as above mentioned, also for each separate group or building as mentioned above.

(5) For Heating and Ventilating for all the buildings as above mentioned, also for each separate group or building as mentioned above.

(6) For Electrical Work for all the buildings as above mentioned, also for each separate group or building as mentioned above.

The right is reserved to accept or reject any or all bids or to waive any informality in any bids presented. All bids must be in sealed envelopes endorsed "Proposals for New Jersey School for the Deaf," and stating the branch of work estimated upon.

No bids will be considered unless accompanied by a certified check to the order of the State of New Jersey, in the amount of five per cent. of the bid, binding the bidder to execute a contract and bond if awarded to him. The terms of proposal with surety required are fixed by the specifications.

Copies of the drawings and specifications will be on file at the office of the Architects for the purpose of estimating. A limited number of the copies of the plans and specifications will be loaned by the Architects to prospective bidders on deposit of a certified check to their order in the sum of FIFTY (\$50.00) DOLLARS. These drawings and specifications may be obtained by application to Arnold H. Moses, Architect, Temple Building, Camden, N. J. If the drawings and specifications are returned to the Architects and an estimate submitted the check will be returned, otherwise the deposit may become forfeited.

ARNOLD H. MOSES,  
GUILBERT & BETELLE,  
Associated Architects.

Dated October 2nd, 1924.

TREASURY DEPARTMENT, Office of the Supervising Architect, Washington, D. C., October 10, 1924. SEALED PROPOSALS will be opened in this office at 3 P. M., November 10, 1924, for the construction, including the mechanical equipment and approaches, of a one-story brick and tile Post Office building, approximately 98 by 76 feet, in plan at Pittston, Pa. Drawings and specifications may be obtained from the custodian of the site at Pittston, Pa., or at this office, in the discretion of the Supervising Architect. Jas. A. Wetmore, Acting Supervising Architect.

Just remember this: Give out courtesy, kindness, patience and good-will, and you'll get them all back with compound interest. The men who deserve to rank in Class A do not chew the lint and fuss about the small misfits of life. To take what comes and forget the rest is wisdom. Let Braggo give the janitor the call, and the Hall Boys have it out with the Ashbox Inspector—you can't afford to soil your soul with small scraps. Fight on a big scale, or not at all. The folks who have trouble with ushers are always looking for trouble—and find it. Smile, old boy, smile!

Courtesy and Service are always here—

You will find us right on the job with

**Form 3—Job Overhead Summary—Continued**

Class of Expense	Amount
Water	
Sewer	
Special—hauling over, boulevards and bridge, Use of equipment, etc.	
<b>Insurance—Miscellaneous—</b>	
Fire, tornado, earthquake, riot, theft, boiler, plate-glass, automobile, payroll, etc.	
<b>Petty Cash Items</b>	
<b>Interest—</b> On deposits and job funds	
<b>Cutting and Patching for Trades</b>	
<b>Contingencies—</b> Guarantees;	
Labor—strikes, rates, output; weather—rains and freezing.	
Acts of God—floods, cyclones, earthquakes; Material—shortage and price; Transportation—rates, shortage; Subsoil conditions; Finance—interest rates, credit restriction; In-equitable Contract Provisions; Supervising Personnel	
<b>Cold Weather Expense</b>	
Thawing Materials—sand, gravel, etc.	
Weather Protection—window and door closures, temp. walls canvass, etc.	
Temporary Heat—installing, maintaining (include fuel either here or under Coal and Coke)	
<b>Repairs—</b> Streets, sidewalks, property	
<b>Pumping—</b> De-watering (if preferred, cover under Excavation or Sheet piling).	
<b>Final Clean Up—</b> Windows, walls, floors, and premises	
<b>Association Dues—</b> Job share	
<b>Share of General Company Overhead</b>	
Expense of home office, shops and yard including estimating, investigations, etc., and dead time of permanent field force.	
<b>Special Items Not Listed Above.</b>	
<b>Total Job Overhead</b>	

*Job Overhead Summary*

Very often tasks are undertaken on the basis of estimates furnished, which estimates are filed away once the job is obtained. This is a very slipshod procedure. The job is undertaken on the basis of estimates given and every subdivision of the job should be carefully controlled on the basis of the estimate. With this qualification, frequently jobs are entered into on carelessly made estimates; estimates filled with an over optimistic spirit, or estimates made on too liberal a basis. When the job or contract is once received, the estimates should be carefully scrutinized and gone over, and on the basis of such resurveyal, tasks for the various departments should be established.

In the Construction Industry the estimate can be used in at least four or five ways:

1st—The Contract Manager will receive therefrom allowances he may have in awarding the various subcontracts.

2nd—The estimate will set limits for the Purchasing Agent in placing orders for necessary materials.

3rd—The estimate will enable Job Supervisor and Construction Assistants to watch very closely labor costs.

4th—The estimate will enable the Planning Department to schedule carefully

the work, that it may be completed on time.

5th—The estimate will enable the Cost and Financial Department to check up the profitable or unprofitable character of the character of the contract while in process of completion.

A few construction companies describe their use of the estimate, as follows:

"All of our estimates are made in detail, with complete take-offs, covering all portions of the work. A summary of this estimate goes to the contract manager; the complete take-off with prices goes to the purchasing agent; and the complete estimate goes to the erection superintendent, or job supervisor. The construction superintendent on the job is given a revised estimate which includes the estimate of the bare labor necessary for completion of the job. This estimate is revised so that all overhead items are eliminated, and all items of profit."

\* \* \*

"The most important use of the estimate is in regards to the labor cost of the job. The cost clerk in the main office is given a copy of the estimated labor cost. The weekly costs are divided into the various sub-divisions of labor. These are added up weekly and compared with

the estimated cost. Copies of the actual cost as compared with the estimated cost are given from time to time to the job Supervisor and the Construction Superintendent. In this manner, a close check is kept upon the labor cost and should it appear to be running over what has been estimated, it is caught, and if possible remedied during the course of the job, rather than at the completion of the job when it is too late."

\* \* \*

"We make careful estimates of all construction work on which we take contracts. When a contract is closed we make a new statement which is called a "bogey," following the terms of golf, which is a very careful analysis of the actual job after we have had time to give it study, and the unit prices are fixed as to what can be done if the working force will do their very best, and cannot be reached unless they do exert themselves completely. This bogey is usually much less than the estimate. The job timekeeping is subdivided daily and each of the operations and important ones are worked out into unit costs daily for the superintendent, and the whole thing is worked out once a week. Copies are sent to home office as used on the job. This keeps the work under close control. Everyone interested has a copy of this bogey—Contract Manager, Purchasing Agent, job supervisor, and construction assistants on the job. Any variation from this score upward is given very prompt and careful study. We also, whenever possible, and this is very frequently, set up a task and bonus for the superintendent, foremen, gang bosses and workmen such as a lump sum if they meet the bogey and one-half saving if they beat it."

*Equipment Rental Schedule*

The schedule of percentage values given below represents for individual construction machines, the annual expense of equipment ownership, expressed in terms of original capital investment, based on the experience of a large number of representative construction firms. These percentages, which include no allowance for profit, apply to equipment operating under the wear and tear of ordinary job conditions. Exceptionally favorable or unfavorable conditions would warrant changing the values as individual judgment indicated. The original capital investment of a machine is the price F. O. B. constructor's unloading point.

Further explanation of the schedule and the methods of determining rental charges are given on the following page:

Form 4—Annual Equipment Expense

Items of Equipment	Economic Life Yrs.	Form 4—Annual Equipment Expense							Total
		Depreciation (Salvage Value) 25%	Interest at 6½%	Shop Repairs	Field Repairs	Storage Incidentals	Insurance	Taxes

Wagons, hauling	4	18¾	4	12	3	3½	1	1	43¼
Wagons, loaders, power	5	15	4	10	3	3½	1	1	40½

Seven items of equipment expense constitute the total rental charge and require consideration in estimating a lump sum contract or in determining fixed rate rentals.

They are (1) Depreciation, (2) Interest, (3) Shop Repairs, (4) Field Repairs, (5) Storage and Incidentals, (6) Insurance, (7) Taxes. Some of these items, especially depreciation and repairs, vary for different machines, and it is to establish average values for the most important articles of equipment that the schedule above has been drawn up.

#### How to Determine a Typical Rental Charge

As a basis for comparing different machines, it is assumed that their economical life is over when the depreciation has reached 75 per cent., or, in other words, when the salvage value is reduced to 25%. Upon this basis the annual rental charge for a machine having a life of six years is made up as follows:

	Percent
1. Average depreciation	12½
2. Equivalent annual interest at 6½%	4
3. Shop repairs	6
4. Field repairs	4
5. Storage and incidentals	3½
6. Insurance	1
7. Taxes	1

Total annual expense ..... 32

But the total annual expense is charged off during the usual working time in each year. Thus, where machines are used only eight months out of twelve, the monthly charge is one-eighth of 32 per cent. or 4 per cent. per month. Likewise, where they are ordinarily utilized but 100 days in the year, the daily charge is one one-hundredth of 32 per cent., or .32 per cent. per day.

#### Interest on Investment

Interest at the prevailing rate is charged each year on either the depreciated value of equipment or on the average value throughout its economical life. The average value equals the sum of initial value and the salvage value, divided by two. When the salvage value is 25 per cent., the average value =  $(100\% + 25\%) \div 2 = 62½\%$  of the initial value. The prevailing interest rate is applied to this amount, giving the equivalent annual interest. Thus the equivalent annual interest is  $62½\% \times 6½\%$  (prevailing rate) = 4% of the initial value.

#### Three Types of Charges

Owners of equipment find occasion to establish rental rates as follows:

1. For a lump sum or unit price estimated.
2. To owners on cost-plus work.
3. To others than client owners.

In these instances charges are made as follows:

## Changing an Attitude of Mind

It has been the tendency of the public to look upon insurance as something on which it must first be "sold" by convincing arguments of the insurance man.

That this attitude is undergoing a change is evidenced in the number of people who no longer wait for the agent to solicit their business but who seek out the agent and ask for insurance advice.

By its national advertising the Insurance Company of North America is helping materially to bring about that hoped for time when people will "consult their insurance agent as they consult their doctor or lawyer."

Represent North America.

*Queens Court Apartments,  
Broad St. above 65th Ave.,  
Oak Lane, Philadelphia, Pa.  
Architect, Edward A. Roth,  
1050 Drexel Bldg., Philadel-  
phia, Pa.; Owners, Fox Bros.,  
Philadelphia, Pa.*

## *The Natural Selection for Heating these Apartments*

Hundreds of apartment houses, similar to the Queens Court Apartments of Philadelphia, are built throughout the large cities of the United States.

The architect, in making the design, naturally takes into consideration how deep he must go in excavating for the basement. Each extra inch saved in depth saves considerable money for his client.

Every square foot of space in the basement is valuable, so the more the architect saves from the space required for the heating system, the more money is placed in the pocket of the owner.

The Novelty Carburetor Boiler with its

low water line of fifty inches saves several inches in excavation. The small amount of space required for firing the boiler on account of its side-feed construction reduces the amount of space needed for the heating system itself and allows more space for other use.

The fact that the Novelty Carburetor Boiler burns all kinds of fuel, including soft coal, the smaller sizes of hard coal, and oil, immediately solves the fuel problem, which is one of utmost importance today.

In view of these facts, the Novelty Carburetor Boiler installed in the Queens Court Apartments was a natural selection.

*Write for illustrated and descriptive booklet giving worth-while facts about space-saving, low water line of 50", long life and fuel saving. Address Department B-G-10 at the nearest office.*

work where the cost of depreciation and repairs may be doubled, or nearly so.

#### *Individual Judgment Needed*

In using percentage such as those given in the rental schedule above, there is danger unless the conditions under which the equipment is to work are carefully investigated.

To illustrate: If the values here given for a standard-gauge shovel outfit were applied to such an outfit engaged constantly in excavating hard rock, the probability is that the charges allowed would not cover the expense. Frequent dokey shots and the dropping of heavy boulders into cars entail a higher rate of depreciation and repairs than is given in the schedule. On the other hand, if this shovel outfit were steadily engaged in digging sandy loam, the values given in the table would probably cause the equipment charge to contain an element of profit.

Such a rental schedule sums up the experience of typical firms, and its value to others depends upon the individual judgment used in interpreting it in the light of the circumstances surrounding any particular job.

The following is a form of Weekly Unit Cost Report employed by a large construction company, for the various features of the contract. Note the comparison of actual unit costs with estimates. See Form 5, previous page.

In connection with the foregoing weekly report, the Summary Cost Report of the following general description may be used. See Form 6, previous page.

Form 6 may be subdivided into three forms if it is not desirable to show the time, cost and profit trends on one report.

One great secret of success in the construction industry is to make the estimate work for you. The estimate represents the task undertaken by the organization and it is up to everyone in the organization to see to it that the work is completed within the limits therein set down. In this connection, for the information of contractors who are not familiar with it, the Building Estimate Summary of the Associated General Contractors of America is reproduced on this page.

The other day a prominent local architect called up to inquire regarding a concern that has not advertised with us for two years. "I saw their ad. some years ago in the Guide," said the architect, "and am unable to recall just where they are located." We gave him the address and learned subsequently that as a result the firm bagged a big order. How many similar orders, from architects who wouldn't take the trouble to look them up, that same concern has missed in the course of the past two years it would interest us to know.

### Form 7—Building Estimate Summary Sheet

Class of Work	Amount
Wrecking, Moving and Clearing Site	
Temporary Construction—Office, Sheds, etc.	
Excavation, Grading, Backfill and Special Fill	
Foundation Support—Piles, Caissons, Cribbs	
Shoring, Sheeting—Temporary, Permanent	
Underpinning—Temporary and Permanent	
Water Lines, Gas, Drains, Sewers, Conduits	
Paving, Curbs, Sidewalks and Drives	
Concrete—	
Concrete Surfacing and Cement Work	
Concrete Forms—Wood, Metal; Metal Arches	
Reinforcing Rods and Mesh; Metal Inserts	
Concrete Block	
Common Brick	
Face Brick	
Fire Brick; Flue Lining and Special Brick	
Hollow Tile—Load Bearing and Partition	
Terra Cotta Fire Proofing—Arch, Furring, etc.	
Gypsum Block—Lintels, Furring, Book Tile	
Water and Dampproofing	
Architectural Terra Cotta	
Artificial Stone	
Cut Stone—Lime, Sand, Blue, Etc.	
Exterior Marble and Granite	
Structural Steel and Iron	
Metal Lumber	
Stacks—Metal, Brick, Concrete	
Ornamental and Miscellaneous Iron	
Iron Doors, Gates and Shutters	
Vault Lights	
Metal Store Fronts	
Bronze and other Art Metal	
Lumber. Wall Board and Rough Carpentry	
Insulation and Sound Proofing	
Millwork and Finished Carpentry	
Special Cabinet, Panel, Stair and Door Work	
Artwood Floors—Parquetry	
Rough Hardware	
Finished Hardware	
Roofing—Non-metal, slate, tile, composition	
Sheet Metal Work, Plain; and Metal Roofing	
Pressed Sheet Metal—Ceilings, Panels, etc.	
Metal Furring, Lathing, Corner Beads, Grounds	
Plastering—Plain Ornamental; Plaster Board	
Stucco	
Imitation Marble and Stone, and Scagliola	
Interior Marble, Slate, Stone, Carrara Glass	
Tile, Mosaic and Terrazzo	
Composition, Cork, and Patented Floors	
Kalamein and Other Fire Doors and Windows	
Hollow Metal Doors, Windows and Trim	
Steel Sash and Partitions	
Caulking	
Weather Strips	
Glass and Glazing	
Priming and Painting	
Decorating	
Plumbing and Gas Fitting	
Electrical Wiring	
Electrical Fixtures	
Heating and Ventilating; Boiler Setting	
Elevators, Dumb-waiters, Hoists; Controls	
Elevator Doors and Enclosures	
Mail Chutes	
Pneumatic System	
Vacuum System	
Refrigeration System; Refrigerators	
Sprinkler System	
Tanks	
Vaults and Vault Doors	
Revolving Doors	
Awning, Shades and Blinds	
Fly Screens	
Floor Coverings	
Special Equipment not otherwise listed	
Special Interior Fixtures	
Landscape-Leveling, Sodding, Planting	
Job Overhead—Equipment, Fees, Permits, Etc.	
Compensation, Liability, Contingent Insurance	
Total Cost—Labor, Material, Sub-bids	
Margin and Profit	
Bond	
Amount of Bid

## Changing an Attitude of Mind

It has been the tendency of the public to look upon insurance as something on which it must first be "sold" by convincing arguments of the insurance man.

That this attitude is undergoing a change is evidenced in the number of people who no longer wait for the agent to solicit their business but who seek out the agent and ask for insurance advice.

By its national advertising the Insurance Company of North America is helping materially to bring about that hoped for time when people will "consult their insurance agent as they consult their doctor or lawyer."

Represent North America.

## For Permanently Hard and Waterproof Concrete

THE addition of "ANTI-HYDRO," a liquid integral compound, to the gauging water produces extremely hard and absolutely waterproof concrete all in **one operation**.

For waterproofing concrete cellars, walls, foundations, pits, stucco, mortar, etc., "ANTI-HYDRO" has no equal. It is easy and economical to use—simply mix it with the gauging water.

For 20 years "ANTI-HYDRO" has given complete satisfaction on every type of concrete hardening and waterproofing work.

## As The Editor Sees It

### SEMI-ANNUAL STATEMENT BY AMERICAN CONSTRUCTION COUNCIL

Through Its President FRANKLIN D.  
ROOSEVELT

THE semi-annual statement of the American Construction Council covering the present situation as regards the construction industry, was made public recently through its President, Franklin D. Roosevelt. The statement is as follows:

"In making public its semi-annual review of conditions affecting the construction industry nationally, the American Construction Council finds as the outstanding feature at this time a growing insistence on the part of the building-investing and home-owning public for better quality of construction and greater responsibility in financing and in other phases of building operations.

"This increasing demand for better building, a movement which the Council sponsored on a national scale last Spring, is accompanied by a general undertone of increasing confidence as to greater stability in the construction industry throughout the country as a whole. While it is not possible to say that construction is actually on a stable basis, a more favorable trend than has existed for the past several years is indicated in this regard both by the volume of operations and by the type of new work coming out.

"There has not been the marked seasonal decline appearing so noticeably in the past with the coming of the Fall and Winter months. On the contrary the amount of new work contracted for and begun has held up for this time of the year unusually well. This shows a very favorable response on the part of the public to the general movement to promote the scheduling of building operations so as to take advantage of the relative slack in materials and labor during the Fall and Winter months, which has been frequently urged by the Council, the Federal Department of Commerce, the Building Congresses in various communities, and others. Undoubtedly the slowing down of speculative building, which curtailment the Council has urged both as a steadying influence in construction activities and as a phase of better building in general, has done much to make this possible.

"Even a more significant fact stands out as to the present type of building operations. There is a larger ratio of commercial and industrial structures contracted for than has been seen for some time, showing a tendency towards greater confidence on the part of business generally and particularly as to its willingness to go ahead with investment in buildings for its own use. Residential construction is still going forward in large volume in some districts but it appears to be of a better average type in most sections than has recently existed. There

has been a small recession in cost. Outlying districts and the smaller communities are sharing more largely in the work now under way than they have for some time in the past, another indication of the beneficial results being secured through the steadying and bettering of operations in the industry.

"The impetus already given to the movement for better building in general and against the purely speculative and questionable type of housing and other undesirable projects in particular is being given permanent direction through the Council's special committee on better building whose primary purpose is to bring the public to a realization of the real business of building and a general adoption of the principles of better building in all of its phases. While the Council is therefore happy to report that the favorable trend already noted as being under way with regard to the construction of both business structures and homes augurs well for the country at large, it is imperative to note that the securing of the desirable ends to be gained depends upon an intelligent and widespread appreciation and application of the necessary correctives.

"A similar need for a better conception and use of the fundamental principles and processes of construction is to be seen also in the field of engineering construction in the larger sense, in which fall such types of work as power plants and similar field projects, highway con-

PRINTS**

struction, public carriers and the like. In the promotion and prosecution of such projects account must be taken of all the elements in construction—from financing, design and engineering on through management, materials and labor—that enter into the problem as it affects building construction itself as already pointed out by the Council last Spring.

"In this connection it seems advisable to call attention to the importance of adequate and proper construction of national highways in the development of the industry and commerce of the country. With the constantly increasing scope and complexity of transportation for both business and pleasure purposes, the necessity for adequate and proper highways of the right type is becoming more and more urgent as an economic problem of first magnitude for the country at large.

"Equally important is the proper conservation of the timber resources of the nation. This question enters with regard both to better building and efficient conduct of construction generally and to the permanent continuance of an adequate supply of lumber of good quality. Constructive attention should therefore be given to the demands being made upon the nation's timber resources and the most efficient utilization of lumber in the actual work of construction, and the beneficial measures being taken toward this end by the lumber industry of the country should receive general support.

"The above constitute the Council's general survey of conditions to which it desires to call the attention of the public at this time. The Council recommends in viewing the situation as a whole that the following specific measures be borne in mind by all those interested in any way in construction as it relates to both buildings and engineering projects:

1. "That all who have to do with construction—from financing and design on through materials, management and labor—take specific steps not only in their own lines as such but in co-operation with the other elements of the industry to further eradicate, as already recommended by the Council, the evils arising out of the large percentage of construction of inferior quality and unsound financing. In addition to making a general survey of conditions through its general committee on better building and recommending correctives where deemed necessary, the Council has placed its resources in this entire work at the disposal of the public.
2. "That with the approach of the Fall and Winter season all who contemplate construction of any kind give serious consideration to the scheduling of such work so far as possible at any early date in order to take

advantage of the relative slack in demand for materials and labor during the winter months. This will not only facilitate the progress of construction during the winter season but will also assist in getting ready for work later and thus help in maintaining construction activities on a more even keel. The carrying on of maintenance and repair work during the so-called slack season, as repeatedly urged by the Council, will also do much to help in steadying construction activities and at the same time lengthen the working period thus extending the active season without overlapping or congestion. Custom, not climate, is mainly responsible for seasonal idleness in the Construction Industry, as pointed out by the Committee on Seasonal Operation in the Construction Industries of the President's Conference on Unemployment. The Council supports the various constructive recommendations of this Committee. Undoubtedly the building public is coming to an increasing recognition of the advantages of all-year construction but there still exists the need for ascertaining the facts as to specific procedure and for having such facts readily available.

3. "That the Building Congresses in various communities be encouraged and extended and new ones be organized wherever possible. These Congresses represent the same idea for their respective localities that the Council does for construction industry nationally and as such are the agencies that come before the public in these localities for the purpose of organizing and administering the various activities in their community aspects. It is the opinion of the Council that these local get-together associations are essential in the work of bringing conditions in the industry to the attention of the public and securing the adoption in actual practice of the measures needed to remedy undesirable conditions. The Council therefore supports the local Congresses as a part of the general movement to promote responsibility and intelligent co-operation on the part of all persons interested in construction and thereby secure the basis for insuring very practical benefits to the industry generally and to the public."

In commenting upon the Council's recently concluded meeting, at which this statement was formulated, as the largest and most successful that the Council has yet held Mr. Roosevelt said, "We have given to the public through the newspapers of the country every six months

Brick, structural steel, reinforced concrete, 2 stories, 100x60 feet, concrete and timber roof, hardwood and yellow pine floors, roof ventilators (heating, plumbing, ventilating, electric work separate bids), metal lath, kalamein doors, ornamental iron work. Lowest bidders: B. H. B. Ennis, Jr., Baltimore, Md., \$61,993; W. D. Haddock & Co., 804 Orange street, Wilmington, Del., \$66,518. Plumbing, heating and ventilating, T. T. Weldin & Son, 916 Orange street, Wilmington, Del., \$12,875. Electric work, T. F. Higgins & Co., 843 Tattall street, Wilmington, \$1,295.

**Bungalow**, Wilmington, Del. Architect, John A. McKibbin, Industrial Trust Building, Wilmington, Del. Owner, Samuel Usilton, 1217 West Third street, Wilmington, Del. Concrete block and stucco, 1½ stories, 25 35 feet, shingle roof, pine floors, hot air heat, electric light. Owner will build.

**Residences (2)**, Twenty-seventh street, Wilmington, Del., \$13,000. Architect, private plans. Owners, W. S. Boyce & Bros., 227 N. Franklin street, Wilmington, Del. Brick, 21x32 feet, slag roof, pine floors, hot water heat, electric light. Owners will build.

## Miscellaneous Contracts Awarded

**Restaurant (alts. and add.)**, rear 921 Market street, Wilmington, Del. Architect, R. C. Tindall, 914 Orange street, Wilmington, Del. Owner, Frank Lackey, care of architect. Brick, 1 and 2 stories, 40x26 feet and 12x26 feet, slag roof, electric work. Contract awarded to J. A. Bader & Co., 923 Market street, Wilmington, Del.

**Store and Residence**, 948 Vandever avenue, Wilmington, Del., \$3,000. Architect, private plans. Owner, H. Goldstein, Vandever and Thatcher streets, Wilmington, Del. Brick, 2 stories, 16x21 feet, pine floors, electric lighting. Contract awarded to VanSant Bros., Elmhurst, Del.

(Continued from page 692)

a very carefully and cautiously prepared statement pointing out marked tendencies. We have pointed out these tendencies to the public because in the last analysis they come from the public and the sufferers would be the public. We are working not only for the construction industry but for the public of the United States in order to have them understand construction, appreciate their mutual problems affecting it, increase efficiency, and make for the general welfare and progress of the country."

In addition to the meetings held twice a year to exchange ideas and through addresses and otherwise bring out the existing problems of construction and as a result of these meetings issue a statement to the public, Mr. Roosevelt called attention to the great influence the Council has had as the national body interested in bringing together all elements of the construction industry in order to attack those phases of bad functioning which can be handled only through broad surveys of conditions and promotion of remedial measures in their national phases. The Council for example has given recogni-

tion to the community of interest between the national body and community groups by taking up for very definite action the promotion of community apprenticeship commissions, and the development of training methods and materials for teaching apprentices. It has also given special attention to furthering the organization of new Building Congresses in important construction centers of the country in which it is acting in accord with the National Congress of the Building and Construction Industries; to the giving of national support by the industry to the movement for the reduction of seasonal unemployment; to serving as a clearing house for the distribution of information of interest to the entire industry; to establishing co-operation between the various branches and localities of the industry themselves and the public officials of the country; and to the developing of greater responsibility in construction generally.

## SAVE MONEY—KEEP ON BUILDING

"Construction is the balance wheel of American industry," says Secretary of Commerce Hoover in a foreword to the recently-issued report on Seasonal Operation in the Construction Industries, made by a committee of the President's conference on unemployment. "The ebb and flow in the demand for construction, seasonally and between different years, to a large degree affect our economic stability."

Then, summarizing the findings and recommendations of the committee, he states:

"Bad weather is not the principal cause of seasonal idleness. Customs which became fixed when builders had not yet learned how to cope with adverse weather conditions have not been changed to meet improvements in building materials, the development of new equipment, and innovations in management methods. For most types of construction it now is possible to build the year round in all parts of the United States."

Secretary Hoover and the committee charge materials manufacturers and dealers, as well as all other elements in the building situation, with the responsibility of educating potential builders to the fact that they *can* advantageously build in cold weather and as to *how* they can do so. The Department of Commerce thus lays the foundation for a movement to "keep on building." The United States Gypsum Company has undertaken a share of the responsibility for such a movement. It has got under way a campaign to educate prospective builders in the methods of building with gypsum materials during inclement weather.

Data assembled by the Gypsum Com-

pany last year show that building costs in Winter are materially less than those in Summer. Completion is quicker. Materials are cheaper during the "off season." Labor is more efficient, easier to find and less exacting as to wages. Contractors who employ men the year-round are not confronted with demands for bonuses and extra wages such as are demanded during peak-seasons when the industry is working on an eight-months-out-of-12 basis. Modern equipment makes it possible to maintain the proper temperatures in buildings under construction at lower cost than previously was necessary.

In the Gypsum Company's survey, reports were obtained on one building costing \$750,000, on which a saving of \$87,710 was made by Winter construction. The total cost of protecting it from weather was \$3,863, made up as follows: temporary protection for labor and material, \$871; tarpaulins, \$667, with a salvage of \$442; temporary heat, \$668; salamanders, \$302; coke, \$304; boiler attendants, \$1,036; coal for boiler heating, \$150; temporary lighting, labor and service, \$196; snow clearing, \$111.

Brick-layers who, during the previous summer, were being paid \$14, \$16 and even \$20 a day, worked on this job at \$10, and their efficiency was found to be 18 per cent. greater than in hot weather. The brick-work cost a total of \$28,150. Had it been done during the peak period of the preceding summer, it would have cost \$5,630. Saving on other labor amounted to \$25,680, and \$16,030 was saved on materials as compared with what they would have cost in the summer.

Another contractor estimates that protection of concrete in winter cost him 5 per cent. of the contract, but that this was more than offset by economies in labor-costs.

Similar economies are possible through the use of gypsum building materials. Many of them are factory-cast and consequently are unaffected by temperature, and those that are not cast set into their initial hardness more quickly than other materials. Sheetrock wallboard is one of the cast materials and it makes winter-construction of small dwellings possible. For this reason it has been used in many housing projects which had to be completed in Winter. Besides being unaffected by cold, this material has the advantage of coming in large units, which speeds up installation and effects economy in labor-cost.

In analyzing conditions affecting plastering, the United States Gypsum Company has recognized that one of the principal dangers is that the keys which form the mechanical bond between the plaster and wood lath are likely to freeze before they set and so fail to function as a clinch. Even where steam-coils or salamanders are installed, there is the danger

that, while the plaster on the inside may set, the keys will freeze.

For this reason the company has perfected Gyplath, a fireproof substitute for wood lath, which entirely eliminates the keys and makes it possible for the plasterer to work on a solid background of insulating material which keeps the cold out until the plaster on the walls and ceilings has entirely set. This has caused many contractors to specify Gyplath, or "plaster board," for winter work.

The advantage of using gypsum plaster is that it sets in a few minutes and attains virtually its full strength within 24 hours. So it is not necessary to maintain heat in a gypsum-plastered room more than one day. Furthermore, the use of gypsum wood fibre plaster obviates the necessity of using sand which, when it is damp and frozen, causes delays and difficulties in plastering.

All gypsum fireproofing, tile and poured constructions can be carried on in Winter with a minimum of additional expense. Structural gypsum generates sufficient heat in the mixture to keep it from freezing during the few minutes required for it to get its initial set.

Use of such materials as these will, as Secretary Hoover points out, mean an improvement of labor and other conditions in the building industry and a material scaling down of the congestion and expense of the nation's annual building program.

#### SHOWS BUILDERS NEW SOURCE OF PROFIT

"Tomorrow's profits must come from today's wastes," declared Ray M. Hudson, chief of the Division of Simplified Practice, U. S. Department of Commerce, to an audience of representatives of the building industry, comprising the New Jersey Building Congress, meeting in Newark recently.

"When the Hoover Committee on the Elimination of Waste in Industry made an expert survey of six of our major industries, it found that the building industry stood in fourth place, with 53 per cent. waste," he continued. "Thirty-four per cent. was chargeable to management, and one of the major causes is lack of simplification and standardization in materials, methods, machinery and so on.

"Think what this means, when you consider that more than five billions of dollars are spent annually in construction in this country."

"The Department of Commerce, through the Division of Simplified Practice, is endeavoring to help the building industry in checking this waste. It is helping to bring about the reduction of unnecessary variety in sizes and dimensions and other immaterial differences in

every day commodities. It is not standardization, nor is it technical but it is based on sound economics.

"Our Division has co-operated with the producers, distributors, architects, engineers, contractors in simplification projects in the field of building. Sixty per cent. of the variety in finished sizes of soft lumber; 81 per cent. of the variety in metal lath; 98 per cent. of the variety in brick sizes; 47 per cent. in hollow building tile, and 51 per cent. of the variety in roofing slate have been eliminated; and this action has been taken by all groups concerned.

"This co-operation between Government and Industry contains nothing regulatory or inquisitorial. Our job is to help such groups as are interested in reducing waste to get the facts and to put their action into practice.

"Many of the 18,000 or more business failures in 1922 were due to frozen capital, due to excessive stocks or inventories resulting from carrying too many varieties of the same thing. Simplification helps release frozen capital, helps keep stocks liquid and turning faster. Reducing variety means quantity production and lower costs; and quantity buying means lower prices, enabling both manufacturer, distributor and consumer to do business on a quantity basis.

"You have the opportunity to make further savings by buying standardized materials, by applying the recommendations given in the engineer's report entitled 'Waste in Industry' and in the more recent report on 'Seasonal Operation in the Construction Industries.' To keep things on an even keel you have to do business on a quantity basis, cut out the wastes, operate your business so you can give full value for the prices you ask, and still make a fair profit. You can do this in proportion to the extent you co-operate in support of the simplified practice recommendations covering building materials, equipment and supplies.

"Simplification is an important factor in the continued success of American industry, and we hope that you will put it to work in your field, not because we suggest it, but because you see in it greater opportunities for you all, individually and collectively."

#### FEW LIMESTONE BEAMS KEEPING STRAIGHT

Progressive sagging during long continued application of load has occurred in most of the eighteen limestone beams undergoing fatigue tests at the Bureau of Standards. None of these beams have broken yet. The greatest amount of bending in addition to that produced by the initial application of the load is .005 inches, while the average is .002 inches.

These beams are 28 inches long be-

tween supports with a section 4 inches wide by 1½ inches thick. They are supported at their ends and carry at the middle a load equal to two-thirds of the load required to break them. In this condition they have remained now for about 16 months and will remain for a long time to come. The load is to be increased, however.

Many cases of fracture in stone buildings have occurred, the bureau states, in which the load was not excessive and in which failure appears to have resulted from long continued application of the load. Marble and granite slabs have been known to assume a permanent bend or warp under a very slight load, and incidents of this warping in the case of marble can generally be found in old graveyards. Such warping is less common in granite, but a case has come to the bureau's attention in which some granite steps were warped to such an extent that they had to be redressed, as a result of being left on the ground for some time before use.

#### SALTS IN OIL SMOKE INJURE SLATE ROOF

Salts contained in the soot from an oil burner were found by the Bureau of Standards of the Department of Commerce to be the cause of extensive decay in the slate roof of the building in which the burner was housed. These salts, being soluble in water, were leached into the slate by the rains and were recrystallized in dry weather. The formation of the crystals tends to pry the particles of slate apart and produce an effect similar to frost action only much more severe.

The disintegration of the slate was first noticed about six years ago and in some parts of the roof it has progressed to the danger point. It manifests itself only on the interior and is invisible from the outside. The process begins at the edge of the shingles and progresses along the direction of the cleavage, reducing the slate to powder.

All advertising pays—even that which is poorly constructed. A bad ad. is better than no ad. at all. It is worth all that it costs in the competitive world of the present day, merely to keep one's name where the possible buyer cannot help seeing it. To be out of sight in the commercial world is to be out of mind.

Advertising is telling who you are, where you are, and what you have to offer the world in the way of service or commodity.

If nobody knows who you are, or what you have to offer, you do no business, and the world is the loser through giving you absent treatment.

Life is too short for the consumer to employ detectives to ferret out merchants who have the necessities of life to sell.

## Changing an Attitude of Mind

It has been the tendency of the public to look upon insurance as something on which it must first be "sold" by convincing arguments of the insurance man.

That this attitude is undergoing a change is evidenced in the number of people who no longer wait for the agent to solicit their business but who seek out the agent and ask for insurance advice.

By its national advertising the Insurance Company of North America is helping materially to bring about that hoped for time when people will "consult their insurance agent as they consult their doctor or lawyer."

## As The Editor Sees It

### FIRE RESISTIVE HOUSES A PRESENT REALITY

BY WHARTON CLAY

*Architectural Engineer, Member of the  
Building Construction Committee  
National Fire Protection  
Association*

If an architect and engineer and a criminal incendiary should get their heads together, they could hardly devise a better construction for rapid destruction by fire than the present residence or apartment building with lumber joists, studs and ordinary lath. Even the plaster, which is incombustible itself and would be considered a fire protection of high order, aids in making a series of chimneys to aid in the draft, and when this plaster is installed, as is customary, the entire interior of the chimney is lined with small pieces of rough wood easily ignited, and which communicate a fire with incredible speed throughout the structure. This does not mean that lumber must be eliminated to make houses fire-safe, but to make them fire-safe, the lumber must be protected in a manner different from the present custom and the myriad of small pieces of wood must be eliminated.

It seems strange that the design of fire-restrictive construction should have started at the top and worked downward to the residence. It is strange that city ordinances give more consideration to the protection of the lives of transients with-

in their boundaries living in hotels than is given to their own citizens whose lives are in constant peril in houses that strictly conform to all the laws. Stranger yet, that a man will demand a fireproof vault in which to store bond and stocks, and yet will leave home light-heartedly with his dearest possessions soundly asleep in a tinder box which, on the slightest spark, in a few moments will become hopelessly involved in a rapidly enveloping fire. In fact, the modern house, if constructed scientifically at all is built so as to permit the flames to spread in the most rapid manner that could possibly be devised.

Lumber construction, because of its strength, ease of cutting and fitting, and the familiarity of the workmen with it, is today the most economical material with which houses can be constructed. Attempts have been made to produce fire-resistive houses with other materials, but they have always ended in financial disappointment because of the extra burden it places upon the home owner. There is another reason, too, why incombustible materials have not appealed to the home owner. We are creatures of habit, and are familiar with wood and appreciate its beauty. We do not like to see the cold floors and do not readily respond to a different form of construction. Fortunately, there is no need for this, for within our grasp and within reach of our pocketbooks lie materials which will make the fire-resistive home a present reality.

In fact, there are many that have been built throughout the length and breadth of this land, and their safety has been tested by actual fires, which, obtaining a start, are stopped before they gain headway.

Metal lath as a protection for lumber solves the problem as does no other material. It does not change our habits of constructing the building, it does not hamper the speed of erection, and it does not add greatly to the cost. It even lessens the burden on the pocketbook of the householder, because it reduces the depreciation and upkeep expense cost to a greater extent than it increases the original investment.

For over thirty years, expanded metal lath has been known to the general building public as a fire-resistive material. Notable examples of its fire-stopping qualities have appeared from time to time. On the other hand, hundreds and even thousands of houses constructed in the ordinary manner burn down yearly, and we thoughtlessly let them pass without inquiring into the basic reasons why houses should be so readily consumed and take with them so many precious lives.

The true measure of the fire-resistive value of expanded metal lath as a protection for wood was not known until a short time ago; but on the anniversary of Fire Prevention Day, 1922, the Underwriters' Laboratories announced that a wood-studded partition plastered on

**BLUE  
PRINTS**

both sides by metal lath and plaster, and an ordinary wood-stud floor as commonly constructed, but protected on the under side with metal lath and plaster would resist the intense heat of the Laboratories' standard fire test for over one hour and remain intact and carry their loads beyond that period. Shortly thereafter, they announced that ordinary lath and plaster would expose the wood behind it, under the same test conditions, in about four minutes. Thereby *the secret was revealed of the immense life and fire loss in residence construction in America.*

Fire preventionists have pointed out the comparison between the fire losses in Europe and America and have attributed it to greater use of incombustible exterior walls in Europe and the common use of frame construction in America. Even the statistics of fires in this country are disregarded when such a conclusion is reached, for we find in the report of the Committee on Statistics on Origin of Fires, dated May 22, 1919, and issued by the National Board of Fire Underwriters, that in the column headed "Percent of Fires Confined to Building or Place of Origin" that the percentages run in the following manner: 99, 91, 98, 98, 97, 94, 100, 96, etc., giving as a general average for every reported city in the United States, a figure well above 96 per cent.

In other words, the fire hazard in America is not due to the spread of fires such as the exterior wall might have some control over, but is due almost entirely to fires which start in certain buildings and involve the building of origin only. That is, the interior construction represents 96 per cent. of all the fire loss, and the control of this 96 per cent. of the fire loss in this country must be the objective of the thought directed toward improving construction. External construction concerns only 4 per cent of the fires, therefore, it is strange that we have given so much consideration to the 4 per cent and so little consideration to the 96 per cent.

More consideration has been given to the elimination of the wood shingle than

has been given to wood lath. Many cities have legislated against wood shingles, when not more than 2 per cent of all the fires in the country can possibly be attributed to conflagrations involving more than two buildings at a time, and municipal authorities have neglected to provide safety from internal fires which form 96 per cent. of the hazard. They have allowed large credits for incombustible exterior walls and they have permitted ordinary window glass to be put in windows, vitiating entirely the undoubted safety of the wall itself, and from an engineering standpoint, have neglected the adage that a "chain is only as strong as its weakest link." It is true that a stucco-covered frame structure is more fire-resistive than the same structure covered with siding. It is equally true that a conflagration will enter a brick building as quickly as a frame building.

My purpose is not to object to giving credits where credits are due. On the contrary, it is my earnest plea that proper weight and measure be given to the fire-resistive advantage that better interior construction will provide over a period of years.

Not only does expanded metal lath and plaster resist the fire which is endeavoring to break through the plaster coating and get to the interior of partitions, but any fire which originates inside of a partition has little to feed on with expanded metal lath and plaster on two sides and a smooth flat piece of wood studding whose edges are embedded in plaster for each of the other two boundaries. True, this wood can ignite, but the horizontal bridging almost universally placed midway between floor and ceiling of these partitions and walls confines such a fire within a very small bulkhead, and fire stops can also be placed at the floor levels to further reduce the chances of spread of fire. In contrast we have the condition inside of a partition lined with ordinary rough lath of ideal size for propagating a fire.

*Logan Baptist Church, 13th and Ruscomb Streets, Philadelphia, Pa. Heated by one 7-40 and one 4-40 Novelty Carburetor Boilers.*

*Architect: Clyde S. Adams, 2038 Spruce Street, Philadelphia, Pa.*

## *They Need Not Worry*

They burn soft coal; but the Philadelphia newspaper discussions on the prohibiting of smoke does not worry the Trustees of the Logan Baptist Church. They have no smoke. The enforcing of the city ordinance will have no effect upon them.

The heating appliance used there burns the smoke and gases before they leave the boiler. The remaining substance passes out of the chimney in the form of a mist which is practically invisible.

Still more important than this, is the money saved in the buying of fuel. Most churches are confronted by the question of finances. The trustees of the Logan Baptist Church reduced their coal bill two-thirds by burning soft coal.

The Novelty Carburetor Boiler is designed to burn any kind of fuel, and this enables the

church authorities to buy the cheapest and most available kind.

The patented carbureting chambers (one to each section), on the rear of the boiler, automatically mix all of the smoke, gases, and carbon with the oxygen from the air and burn them. The air enters the top and bottom slots of the Carburetor, as illustrated in the picture. No adjustment of air intake is necessary, because the rate of combustion determines the amount of air required.

Visit our factory showroom and see the boiler for yourself; or, if you prefer, write us for a list of the Carburetor Boiler Installations in Philadelphia. Send today for the illustrated and descriptive booklet which gives the facts about space-saving, low water-line of 50", long life and fuel saving. Address Dept. BG 11.

Hollow tile and stucco, 2½ stories, 45x70 feet, 2 stories, 22x28 feet, tile roof, hardwood and cement floors, vapor heat, electric light, tile and marble work. Architect taking bids due November 12th.

(Continued from Page 708)

It is, therefore, not necessary to depart from the time-honored wood stud and wood joist construction, whether surrounded by a masonry wall or a wood-studded wall covered by either wood siding or stucco, in order to obtain a fire-resistive interior that will give ample protection against a large majority of the fires which statistics show are likely to involve the interiors.

There is a type of partially protected fire-resistive construction which will give the greatest protection for the least extra cost. These are houses which are "built like a battleship," in which the expanded metal lath is used to protect the most vulnerable points, as the battleship designer puts the heaviest armour around the turrets and around the boilers. These vulnerable parts are:

1. *On all stud bearing partitions and fire stops between studs. (Fire stops to be metal lath basket-shaped to fit between*

*studs, coated with plaster or cement and filled with incombustible materials.)*

2. *On ceilings under inhabited floors, especially over heating plants and coal bins.*

3. *At chimney breasts, around flues and back of kitchen ranges.*

4. *For stair-wells and under stairs.*

5. *Exterior walls.*

These are the positions in which the greatest probability of fire exists, or the positions in which fire, if it does start, will do the greatest and quickest damage. While this is not an ideal or ultimate solution, its encouragement is a step in the right direction, and on account of the relatively small additional expense and the crack-resisting advantages it can be more quickly advanced than complete protection.

Fire-resistive houses are a present reality. They simply have not been recognized.

A house has been built in one of the suburbs of Chicago as a model of this type of construction. It was built with the purpose of calling attention of the fire prevention world to the fact that a fire-resistive house could be built at only little extra cost, along the most artistic lines, without deviating in the least from the requirements of the modern housewife as to the exterior appearance of the home or the beauty of its interior. In fact, this house will be free from upkeep expense of repairing plaster cracks and redecorating wall surfaces because of stains or dust marks following the contour of ordinary lath, and will be absolutely safe for the lives of the children who are to live in it. The extra cost will be not more than 2% of the cost of the building.

Fire resistive houses of this general type exist in many communities, but they are not recognized for their intrinsic value, and they are not encouraged by the insurance fraternity whose powerful influence could do so much to bring a realization of the lessened risk of adequate compensation through reduced rates.

The house mentioned here has expanded metal lath covering the underside of all floors and both sides of all partitions and walls. The built-in garage is separated completely from the house by this one-hour rated construction and there is only the smallest possible chance that any fire, however, started, could gain head way fast enough to get out of control.

Much thought has been given to the question of conflagration, but conflagration has been considered only in the terms of a multiplicity of buildings. There is good reason to take a page from the experience of the Naval engineers and encourage a form of design which will make it impossible for any fire to get out of its room of origin for one hour. Na-

val architects, analyzing their problem, found that when a leak occurred in the hull of a vessel that the whole vessel was doomed. They, therefore, developed a system of bulkheads which makes each compartment so water-tight that the vessel will float even if an entire compartment is filled with water. Fire prevention engineers have recognized this same principle in large buildings where they have built fire walls, equipping each opening with automatic self-closing doors, and the same engineering principles can be adopted in the modest dwelling. Burning of the entire structure can be reduced to the burning out of a single room or compartment. The total loss in fires would hereafter be reduced to the damage in the room or origin only.

We have great hope of the efficacy of fire prevention as taught in the public schools by the elimination of carelessness in the minds of the American youth, but any of you who have children will agree with me that the American youth is very careless and will continue to be so, but probably not nearly as careless as the adult American. Much can be gained by this educational policy, but it is a long process that may and may not bring the desired reduction in fire losses. One thing is certain—built-in fire protection is a constant protection, and fires which originate, outside of all human carelessness, can only be stopped by built-in protection.

*Therefore, I say that fire-resistive houses are at present a reality. Their recognition is but a matter of right thinking along engineering principles, weighing the relative duration of metal lath protected wood construction against the duration of construction as ordinarily built with readily combustible lath, and properly considering the relatively greater importance of interior fire protection as against the comparatively small amount of external hazard.*

## IRON REPLACES WOOD IN CONCRETE FORM CONSTRUCTION

BY HARRY P. TERMANSEN

*Special Correspondent for "The Pure Iron Era"*

*Editor's Note*—Ferrous metal is fast eliminating wood from modern industry. One of the more recent uses in which metal has replaced wood is in the making of forms for concrete construction. This has been brought about because of the longer life and much greater adaptability of metalforms.

**I**N the early development of concrete construction wood was used exclusively for giving it form and supporting the concrete until cured or set; but in recent years iron and steel have been rapidly forcing its abandonment. With the constant trend toward larger

buildings, ferrous metal has proved its greater adaptability and economy for the making of forms used in concrete construction.

Particularly in the bigger cities where the demand is for larger and still larger buildings, especially much higher ones, the problem of storage space for material during the period of construction is an important one, and as metal forms require considerably less room, they offer a great advantage.

Speed is also the cry in the building of large modern structures; for the quicker the building is completed, the sooner will the income from rent begin, and the smaller will be the amount of interest lost on the vast sums which are required to build the mammoth structures of today. Since metal forms can be placed and removed considerably faster than those made of wood, they naturally have won favor by reason of this fact. This is particularly true in the dome type of floor construction, which to a large extent has replaced the solid type, especially in multiple-storied buildings. Two general types of metal forms are used, the removable and the permanent. Where permanent forms are used, they are made of a very light gauge iron or steel which remains in the structure.

The removable type of metal form is made of a much heavier gauge metal which is rigid and permits no deflection or sagging. It is supported on wooden strips, nailed to wooden joists. The strips are ripped out after the concrete has set sufficiently and the metal forms removed and used on each succeeding floor. These forms are light, easily stored on the job and readily handled. Under normal conditions two men should lay in place from 4,000 to 6,000 square feet of floor area in eight hours.

The first cost of forms made of metal is higher than those constructed of wood, but the ever increasing cost of lumber, combined with the fact that wooden forms can be used only a few times—normally from three to five—has led to the use of multiple-service removable iron and steel forms.

Although forms may be standard for all the various floors of any particular building, they may vary considerably in width and depth on different buildings. This would necessitate the purchase of a new set of forms for each building by the individual contractors doing the work, which in many cases would make metal forms too expensive. To meet this condition there has developed the business of manufacturing and renting forms to contractors at a certain price per foot.

The BUILDERS' GUIDE is in its thirty-eighth year of continuous publication.

I make it a rule never to write a grouchy letter—I telephone.

## SHOW PARAFFIN BEST FOR WATERPROOFING STONE

The superiority of paraffin treatments for waterproofing stone has been demonstrated by a weathering test of colorless waterproofing compounds conducted at the Bureau of Standards, Department of Commerce, during the past three years. Samples of Indiana limestone and of sandstone have been used in the tests, one half of each specimen being coated with the waterproofing compound while the other half was left untreated.

Very little deterioration was noticed in the case of the paraffin treatments during the period of the test. Materials using aluminum stearate and mixtures of paraffin and china wood oil were also found to give good waterproofing values when properly applied. Materials consisting of solutions of glue, magnesium fluosilicate, cellulose nitrate, resins, etc., are not sufficiently durable to justify their use, in the opinion of the bureau.

Most of the materials tried discolored the stone to a considerable extent at first, depending on the porosity of the stone. Very dense types were not appreciably discolored while very porous ones appeared greasy for several months after treatment. After a year or more of weathering the discoloration disappeared and the treated surface appeared lighter and cleaner than the untreated.

A new series of tests is being started with these materials on dense limestones and marbles. A new compound has recently come into use in England which consists of a silicon ester. This material is being included in the tests.

## WE ASK YOU

Isn't it funny?  
THAT A MAN WHO CONSIDERS  
HIMSELF A BUSINESS MAN  
Will get up in the morning  
From an advertised mattress,  
And put on advertised underwear,  
Advertised hose, shirt, collar, tie and shoes.  
Seat himself at a table and  
Eat advertised breakfast food,  
Drink advertised coffee or substitute,  
Put on an advertised hat,  
Light an advertised cigar,  
Go to his place of business and  
TURN DOWN ADVERTISING ON THE  
GROUND THAT ADVERTISING DOESN'T  
PAY!

The man who starts out with the idea of getting rich won't succeed; you must have a larger ambition. There is no mystery in business success. If you do each day's task successfully, stay faithfully within the natural operations of commercial law, and keep your head clear, you will come out all right.—John D. Rockefeller.

Don't be a Rip Van Winkle. Advertise and let everybody know you are awake and abreast of the times.

## Changing an Attitude of Mind

It has been the tendency of the public to look upon insurance as something on which it must first be "sold" by convincing arguments of the insurance man.

That this attitude is undergoing a change is evidenced in the number of people who no longer wait for the agent to solicit their business but who seek out the agent and ask for insurance advice.

By its national advertising the Insurance Company of North America is helping materially to bring about that hoped for time when people will "consult their insurance agent as they consult their doctor or lawyer."

Represent North America.

## Insurance Company of North America

PHILADELPHIA

and the

*Indemnity Insurance Company of North America  
write practically every form of insurance except life*

## For Permanently Hard and Waterproof Concrete

THE addition of "ANTI-HYDRO," a liquid integral compound, to the gauging water produces extremely hard and absolutely waterproof concrete all in **one operation.**

For waterproofing concrete cellars, walls, foundations, pits, stucco, mortar, etc., "ANTI-HYDRO" has no equal. It is easy and economical to use—simply mix it with the gauging water.

For 20 years "ANTI-HYDRO" has given complete satisfaction on every type of concrete hardening and waterproofing work.

Stock carried by The Van Sciver Corporation, Parkway at 24th Street, Philadelphia.

## As The Editor Sees It

### CONCRETING IN COLD WEATHER

#### *Winter Work and the Contractor*

**W**INTER work is not new or untried. Millions of dollars' worth of concrete construction is done each winter. Some contractors even prefer winter to summer concrete work. Labor, both skilled and unskilled, is plentiful and the best can be had. Construction material is usually plentiful during the "slack months." The contractor's overhead expense is reduced by keeping his organization busy and his equipment and construction forces in action throughout the year. The extra cost for protection and heat is largely, if not all, compensated by these advantages. The extra equipment for cold weather concreting is very simple but *no cold weather work should be attempted without it.*

The owner who has a building erected during the winter months has the advantage in letting a contract during the off season. He has, moreover, the important advantage of early occupancy.

#### *Winter Work and the Owner*

Frequently it is imperative to have a structure completed and ready for use at the earliest possible date. Schools, residences, apartment houses, office buildings and hotels are usually needed by a certain date. Earlier occupancy of such structures is of prime importance also from the investment standpoint.

Money provided for building construction earns nothing for the borrower until it is represented as an investment in a completed structure, either rented or occupied by the business for which it is intended. It is often penny-wise and pound-foolish to delay the construction of a needed concrete building because of cold weather, for the extra cost of construction in winter would often be more than offset by the interest saved on the money provided for its construction. The bonus or royalty often paid for the completion of a building before a specified time is tangible evidence of the value placed upon early occupancy by large corporations.

#### *General Principles*

The hardening of concrete is a chemical process. Like most chemical reactions this process requires heat. Furthermore, the hardening process is a gradual one, and continues for a considerable time. One of the fundamental things, therefore, about cold weather concreting, is heat—that is, control of temperatures. In general, the higher the temperature (within limits) the faster the hardening process goes on.

Another fundamental in every case of curing or hardening is that moisture *must* be available. The two fundamental factors in cold weather work therefore, are *heat and moisture*. The entire subject of cold weather concreting is encompassed in those two words. Heat that is

without moisture, that causes rapid drying out, does not produce proper curing conditions. Rapid drying out may be mistaken for the completion of the hardening process. If the concrete is not kept moist during early hardening, its final strength will be less than maximum. It is especially important that moisture be supplied along with heat because of the relatively low moisture content of winter air.

If none of the mixing water evaporated or escaped after the concrete is placed, there would be more than enough present for complete hardening. The object of supplying moisture to the surface of fresh concrete is to prevent evaporation of contained water to a quantity insufficient for the hardening process. Warm, saturated air around the fresh concrete satisfies the conditions of curing.

It is a common phenomenon of chemical reactions that a certain temperature of the mixed substances must be established before the chemical action starts. Once started the action usually continues, provided the rate of loss of heat does not exceed its rate of generation by the chemical action.

Thus, portland cement in the presence of moisture must have a certain temperature before the chemical process of hardening begins. However, the chemical process of hardening of cement goes on slowly, and if the heat loss by radiation

**BLUE  
PRINTS**

is very rapid the chemical action will practically stop. Therefore, the first objective in cold weather concreting is to place the material with sufficient contained heat to start the chemical action promptly and then to hold up the temperature so as not to stop or retard the hardening process. The concrete should not be exposed until a strength is attained which will permit the protective measures to be discontinued. By this time the density of the mass will be such as to hold a large part of the contained moisture in such a condition that it will not expand as ice when the concrete is subjected to low temperatures.

Bulletin No. 81 of the Engineering Experiment Station, University of Illinois, contains interesting data on the effect of low temperatures on the hardening of concrete. The data presented shows that some hardening may be expected at temperatures around 32 degrees Fahrenheit, but that the rate of hardening is slow. Some tests were also made to show the effect of alternate freezing and thawing on fresh concrete. The surface concrete of specimens subjected to repeated freezing and thawing attained practically no strength and the strength of the interior portion was only a small fraction of normal strength.

The general principles briefly stated above may be summarized as follows:

1. The hardening of concrete is a chemical process.

2. The temperature of the concrete should not be below a certain minimum (about 40 degrees F.) or the hardening process will not start properly nor will it continue at a normal rate.

3. Green concrete subjected to repeated freezing and thawing will not harden properly.

4. Fresh concrete frozen once, may gain its normal strength, but there is a strong presumption that it will not.

5. During the early stages of hardening, moisture is necessary, and care should be taken to prevent drying out.

6. It is inadvisable to subject green concrete to freezing temperature before it has attained more than one-fourth of its final strength.

7. There is nothing mysterious about successful cold weather concreting—it is simply a matter of keeping the concrete warm and moist. Any method of accomplishing this will produce satisfactory results.

#### *Practical Rules for Cold Weather Work*

Whenever work is started at such a season of the year that cold weather may be expected before the completion of the work, provision should be made to quickly obtain and install enclosing and heating equipment.

Since the concrete should be placed at a temperature which will not delay initial hardening process, it is advisable to heat

both aggregates and water. Simply heating the water but not the aggregates is not enough. The quantity of mixing water amounts to not more than about 20 per cent. of the total volume of the materials and it is obvious that even though the water be introduced into the mixer at a temperature close to the boiling point, the resulting temperature of the hot water and cold aggregates mixed together will be but a relatively small fraction of the temperature of the water. If the temperature of the aggregates is below freezing, a certain amount of frost or ice will be present in them. This frost and ice and the cold aggregate will bring the resulting temperature of the mass below that at which the initial hardening will begin and progress normally. In order to insure prompt beginning of the hardening process, the mass should have a temperature of not less than 60 degrees F. when introduced into the forms, but not to exceed 140 degrees F. The maximum temperature of the mass should not be such as to produce too rapid evaporation of moisture.

There is only one way of knowing the temperature of the concrete as deposited in the forms and its temperature during the first five days after it is deposited, and that is by the use of thermometers. Recording thermometers should be used in the building at several locations and especially on the windward side of the enclosure. Common thermometers should be used to test the fresh mass. Such thermometers may be obtained at an insignificant cost and they constitute an essential part of the equipment for cold weather concreting, because from the data given by them, absolute knowledge may be had as to whether or not the concrete has an opportunity to harden.

Extremes of local climatic changes should be taken into consideration when providing necessary equipment. The speed with which the work is to be carried on should also be taken into account in deciding on the capacity of the heating equipment and the amount of housing material to be supplied. If it be desired to push the work rapidly, sufficient housing should be provided for at least three stories so that one story per week can be constructed.

Tarpaulins of canvas are the most convenient housing material to use. They should be sufficient to provide a tight connection at the lowest floor housed and to completely cover the last floor cast and allow ample room between the canvas and this floor for circulation of heat. Positive provision should be made to allow circulation of heat. It is not enough to insulate the top surface of a green floor and expect that floor to be warm throughout its thickness by absorption of the heat through the slab. Canvas should

# Advance Construction News

CONTEMPLATED CONSTRUCTION: ARCHITECTS AND OWNERS: COST LIMIT: LAST DAYS FOR FILING BIDS:

CHARACTER OF MATERIAL AND EQUIPMENT REQUIRED: ADVANCE INFORMATION IN EVERY PHASE OF NEW CONSTRUCTION

**Club House (alts.)**, 1319 Locust street, Philadelphia, \$20,000. Architect, not yet selected. Owners, Poor Richard Club, care of Howard C. Story, 239 South Camac street. Brick, 3 stories, 46x92 feet. Interior alterations. Contemplated.

**Office Building and Stores**, Chestnut street, Ransstead, Eleventh and Twelfth streets, Philadelphia. Architect, John T. Windrim, Commonwealth Building, Philadelphia. Owners, Estate of Stephen Girard, Lafayette Building, Philadelphia. Stone, steel, concrete, brick, 8 stories. Preliminary plans in progress.

**Art Museum**, Fairmount Park, Philadelphia. Architects, Borie, Trumbauer & Zantzinger, Land Title Building, Philadelphia. Owners, Fairmount Park Commissioners, T. C. Martin, City Hall. Additional work. Plans in progress.

**Garage**, Fifteenth and Windrim streets, Philadelphia. Architect, E. A. Roth, Drexel Building, Philadelphia. Owner, Harry Chervin, 4920 North Broad street, Philadelphia. Brick, steel, 2 stories, 100x100 feet, irregular, composition roof, concrete and plank floors, concrete ramps, hollow metal skylights, rolling steel sash, steam heat, electric light. Plans in progress. Owner will be ready for general bids in two weeks.

**Garage**, rear of 5542-46 Ridge avenue, Philadelphia, \$2,500. Architect, private plans. Owner, Harry Wills, 5546 Ridge avenue, Philadelphia. Brick, 1 story, 20x91 feet 6 inches, slag roof, cement floors, electric lighting. Owner will build.

**Garage and Show Room**, 9057-9 South Fifth street, Philadelphia. Architect, Herman H. Kline, Bulletin Building, Philadelphia. Owner, name withheld. Brick, steel, 2 stories, 42x138 feet, steam heat, electric light, rolling steel sash, metal bulks, plate glass, cement and plank floors, slag roof. Plans in progress.

**Factory (add.)**, Southeast Corner Ninth and McKean streets, Philadelphia. Architect, Herman H. Kline, Bulletin Building, Philadelphia. Owners, Burt Mfg. Co., 1814 Ludlow street, Philadelphia. Brick, slow burning, 4 stories, 32x72 feet, steam heat, electric light, slag roof, maple, plank and concrete floors, rolling steel sash, sprinkler system. Plans in progress.

**Club House**, Southwest Corner Thirty-seventh and Locust streets, Philadelphia. Architect, Robt. R. McGoodwin, 1600 Walnut st., Philadelphia. Owners, Phi Delta Theta Fraternity, Northwest Corner Thirty-sixth and Locust streets. Brick and stone. Details undecided. Preliminary plans in progress.

**Hospital Buildings**, Thirty-fourth and Pine streets, Philadelphia, \$4,000,000. Architect, Philip H. Johnson, 1713 Sansom street, Philadelphia. Owners, Department of Public Property, Bureau of Health and Charities, Dr. W. G. Krusen, City Hall. Plans about completed.

**Administration Building, Women's Building (wing)**, Holmesburg, Pa., \$500,000. Ar-

chitect, Philip H. Johnson, 1713 Sansom street, Philadelphia. Owners, Department of Public Welfare, Bureau of Charities and Corrections, Mr. Grakelow, City Hall. Plans in progress.

**Germantown Town Hall**, Haines street and Germantown avenue, Philadelphia. City architect, J. Molitor, Bankers' Trust Building, Philadelphia. Owners, Department of Public Works, Bureau of City Property. Completion of interior. Plans in progress.

**Shelter Building**, Weccacoe, Catherine, between Fourth and Fifth streets, Philadelphia, \$30,500. City architect, J. Molitor, Bankers' Trust Building, Philadelphia. Owners, Department of Public Welfare, Bureau of Recreation, 595 City Hall. Shelter building, regrading and resurfacing, brick work, iron work, iron fences and gates, carpentry and mill work (plumbing, drainage, electric separate), cement work. Plans completed. Owners ready for bids in a few days.

**Shelter Building**, Whitehall Commons Playground, Torresdale and Wakeling streets, Philadelphia. Owners, Department of Public Welfare, Bureau of Recreation, City Hall. Working plans in progress.

**Stores (5), Apartments (7)**, Fifty-second and Brown streets, Philadelphia. Architect, W. F. B. Koelle, Otis Building, Philadelphia. Owner, name withheld. Brick, stucco work, 3 stories, 21x40 feet, hot water heat, tile work, electric lighting, slag, Spanish tile roof, hardwood floors, plate glass, flush bulks. Plans about completed. Architect will be ready for bids in one week.

**Storage Building**, Folsom street, West of Forty-eighth street, Philadelphia. Architect, J. Ethan Fieldstein, Otis Building, Philadelphia. Owner, Samuel Smilk, 4845 Aspen street, Philadelphia. Brick, 2 stories, 56x31 feet, slag roof, cement floors, electric light. Owner taking bids.

**Residence (alts. for offices)**, 5106 North Broad street, Philadelphia. Architect, George S. Idell, 1705 Chestnut street, Philadelphia. Owner, Dr. C. S. Herrman, 5100 North Broad street, Philadelphia. Interior alterations, heating extension, electric light, rubber floors, plumbing, painting. Plans completed. Builder selected.

**Lodge Building**, Northwest Corner Seventh and Pine streets, Philadelphia. Architect, William L. Charr, 149 South Fourth street,

Philadelphia. Owners, Boslover Benef. Asso., care of architect. Stone, steel, brick, 3 stories and basement, 22x87 feet 6 inches, crushed slate roof, maple and rubber floors, metal window guards, waterproofing and dampproofing, ornamental iron work, floor hardener, bond, kalamein and hollow metal doors, tile and marble work, metal lath, electric light, oil heating. Architect taking sub-bids due November 15th.

**Garage**, 1339-41 North Howard street, Philadelphia. Architect, Irvin E. Spirer, 1304 North Second street, Philadelphia. Owner, Matthias Paulis, on premises. Adamantex brick, 1 story, 32x59 feet, slag roof, cement floors, gas radiator, electric lighting, rolling steel sash, hollow metal skylights, sliding doors, iron and steel work, hardware, mill work. Owner will build and is ready for sub-bids.

**Residence and Garage**, Meadowbrook Lane and Stroud street, Chestnut Hill. Engineer, S. W. Marshall, 1524 Chestnut street, Philadelphia. Owner, name withheld. Brick, concrete block, 2½ stories, 32x30 feet, 2 story garage wing 22x28 feet, shingle roof, hardwood and cement floors, vapor vacuum heat, oil burning system, electric light, metal lath, tile work. Engineer will build and is taking sub-bids.

**Store (alts.)**, 958 North Second street, Philadelphia. Architect, Irvin E. Spirer, 1304 North Second street, Philadelphia. Owner, H. Davis, on premises. Brick work, mill work, plastering, hardwood and pine floors, cement paving, metal ceiling, shoring, demolition, painting, copper bulks, tile and marble work, electric light. Plans in progress. Owner will be ready for general bids in three weeks.

**Office Building (alts.)**, 1026-28 Market street, Philadelphia, \$3,000. Architects, Hoffman-Henon, Inc., Finance Building, Philadelphia. Owners, Stanley Co. of America, 1916 Race street, Philadelphia. General alterations. Architects taking sub-bids.

**Turkish Bath**, 741 Porter street, Philadelphia. Architect, I. W. Levin, 1011 Chestnut street, Philadelphia. Owner, I. Rossman, 729 Jackson street, Philadelphia. Brick, steel, 2 stories, 16x70 feet, slag roof, steam heat, electric light, tile, marble and slate work, concrete swimming pool, plumbing, hollow metal skylights, metal ceilings, waterproofing. Owner will build and is ready for sub-bids.

Contract awarded to Joyce & Kerrigan, 114 North Broome street, Wilmington, Del.

(Continued from Page 724)

be carried entirely outside of the limits of the new floor slab so that heat can pass up to the top of the floor. In addition to this, heat openings should be provided in the floor so that the warm air may pass directly to the top surface of the slab. These openings, of course, are later filled with fresh concrete. They should preferably be placed at about the mid-point of panels and are conveniently formed by using a box in the form of a truncated pyramid, with the small base resting on the floor forms. If steam heat is used, pipes should be run between the top canvas and floor, in which case heat holes are not necessary.

With sufficient tarpaulins for three floors, building operations can be carried on continuously and one story cast per week. The side tarpaulins should be up while the green concrete is being cast and just as soon as each portion of the story is completed, it should be enclosed and heat turned in.

The use of salamanders for supplying heat is very common. There is, however, no certainty as to the quantity of heat supplied by salamanders. They may be fired regularly and with high grade fuel or just the reverse. The gases of combustion and smoke as well as the ashes produced by salamanders are also troublesome. Since in cold weather work live steam is usually necessary for thawing out aggregates, heating water, etc., it ap-

pears that steam provides the best character of heat. The only objection to the use of steam heat is, of course, the necessary piping, but since the steam is used at a low pressure, the piping need not be perfectly tight and the lightest weight pipe obtainable may be used. Steam should be allowed to escape within the enclosure to provide moisture in the air and on the surface of the concrete. The running of such heating pipe is a simple matter, and if the succeeding floors are symmetrical, as is the case, no additional pipe cutting will be required for upper floors. It is well to provide several risers so that one or more of them can be shut off while the heating pipe is being moved up, or turned on immediately after casting a section of a floor. Since the steam pressure is low, neither a high pressure nor a new boiler is required. An old boiler of 20 to 30 horsepower will furnish sufficient steam for the cold weather construction of a building of 5000 sq. ft. floor area.

Heating aggregates with steam is best accomplished by the use of grillages of pipes over which the aggregates are piled. During the time when aggregates are not being unloaded onto the grillages, the piles of aggregates should be enclosed or covered so as to retain the heat. It is usually possible to so locate these grillages that the aggregates can be shoveled from the bottom of the pile practically under cover and transported to a mixer located in the basement of the building, so that comparatively little heat will be lost.

A convenient method of heating water is by means of a steam pipe passed into a tank of water from which the mixing water is drawn.

The forms must be free from snow, ice and frost and should be reasonably warm. Live steam is an effective agent for cleaning and heating forms.

Large masses of fresh concrete are obviously better able to withstand low temperatures than thin slabs or beams. Thus, for bridge abutments and piers it is often sufficient to place the concrete at a temperature of 60 to 70 degrees F. and cover the work to reduce heat loss. If the hardening process attains a normal rate and the work is covered, the heat generated by the chemical action will be sufficient to hold up the temperature for several days. How-

ever, in buildings where relatively thin members only are used, the heat generated by the hardening process should never be depended upon as sufficient.

It is to be regretted that so much gambling with the weather has been indulged in in the past. Especially so, when the methods of cold weather concreting are so simple and so well understood by experienced contractors. It is possible that some contractors have been moved to take chances by the fact that reinforced concrete buildings have been successfully constructed during cold weather without any protection whatever. Many cases have been reported in which concrete has been frozen for a considerable length of time and has thoroughly hardened on thawing out. The assumption that this fortunate result will always follow should never be made. It has resulted in some very unfortunate collapses. The additional expense necessary to make sure and certain that cold weather will not affect the strength or safety of the building, either during or after its construction, is so insignificant that contractors who desire to protect their reputation and the lives of their workmen as well as save themselves from loss, should never neglect to provide the simple equipment required.

#### PRACTICAL POINTS FOR COLD WEATHER WORK

1. Always be prepared to enclose the work and supply heat whenever work that may run into cold weather, is begun.
2. Aggregates are heated to best advantage by 1½-inch steam pipes laid as a grill under the piles or by a 6-ft length of perforated steam pipe, inserted into the pile.
3. Water is heated by running a 1½-inch steam pipe into the water barrel.
4. A 50-horsepower boiler, carrying 50 to 60 pounds of steam is required for a large job, but an 18 to 25-horsepower boiler is sufficient for jobs of not more than 5000 square feet of floor area.
5. One salamander is usually sufficient for 300 square feet of floor area and a heat hole should be provided for each salamander.
6. Columns should be concreted at the same time as the floor and column tamping continued for an hour or more after the floor is concreted.
7. Bases of exterior columns are most difficult to protect and in extremely cold weather a salamander should be placed on each of two sides of exterior columns.
8. For unusual speed or cold weather, or when monolithic walls are carried up, the lower floor should be curtained and salamanders placed at exterior columns.
9. Apply fuel to salamanders frequently and in small quantities, to minimize smoke and provide uniform temperature.

27th and Diamond Streets, Philadelphia

Park  
4981

10. Water barrels should be provided to extinguish fires and care taken to keep canvas from blowing against salamanders.

11. A detailed temperature record should be kept showing date, hour, outside temperature, temperature at bottoms of columns, underside of slab, under the canvas over the slab, temperature of concrete as deposited and, especially, temperature at bases of exterior columns on windward side of building.

12. Aim at a minimum temperature of 60 degrees F. within the enclosure for five days. During protracted cold weather keep the tarpaulins up and maintain a temperature of not less than 40 degrees F. for ten days additional.

13. Do not remove permanent shores until the strength is shown to be three-fourths the design-strength of the concrete.

14. Do not depend on anti-freezing compounds instead of *protection and heat*. Accelerators do not furnish heat to start the hardening process, but once started, accelerators will cause the concrete to gain strength faster *if it is kept warm*. No accelerators or anti-freezing compounds should be used that will decrease the final strength of the concrete, promote rusting of reinforcement or produce efflorescence.

#### THE TRUTH ABOUT THE INFLUENCE OF COPPER ON THE CORROSION OF STEEL

Of late years a great deal of publicity has been given to the special qualities of expanded metal lath made from what are generally known as special analysis steels, that is steels having a chemical analysis different from the regular Open-Hearth steel from which lath is customarily cut. These special analysis steels, no matter what particular trade-mark name the products of individual manufacturers may go under, are Pure Iron and Copper-Bearing steels.

On account of the above mentioned publicity some authentic information is very desirable. The so-called Pure Iron is not really iron at all in any true sense of the word, that is it is not made by the puddling process, but is merely steel which has been put through an extra refining process, sometimes with the addition of other components. Some Pure Iron made in this way is sold under widely advertised trade-mark names, but any other manufacturers who do not advertise a trade-mark and do not exact a premium for their product, can supply material in every way equal.

The additional refining process makes the steel weaker and of less stiffness than the original material, whereas Copper-Bearing steel has all the strength, toughness and stiffness of the original steel, and, furthermore, costs less than Pure Iron. Therefore, if Copper-Bearing steel

is equal to Pure Iron in the one detail used as the basis for promoting the sale of Pure Iron, namely resistance to corrosion, then Copper-Bearing steel has everything in its favor and nothing against it.

Fortunately there is absolutely unquestionable evidence available to the effect that Copper-Bearing steel, from the point of view of resistance to corrosion, is not only equal to Pure Iron but actually very greatly superior. This evidence is found in Volume 23, Proceedings of the American Society for Testing Materials for the year 1923, and Volume 22 of the Proceedings of the same Society for the year 1922. The American Society for Testing Materials is an absolutely impartial body not interested in promoting any one material, but merely in ascertaining facts and establishing standards. The complete findings above referred to made by sub-committee III of committee A-5 of the Society on the corrosion of iron and steel, cover more than 100 closely printed pages with numerous exhaustive tabulations. Anyone wishing to go into the subject in great detail will find the printed proceedings of the Society in any technical library, and, no doubt, in many city libraries. The high spots of the findings, however, are abstracted below.

A large number of sheets of steel of various compositions, including ordinary steel, both basic and Open-Hearth, also Pure Iron and Copper-Bearing steels have been exposed to atmospheric action at Fort Sheridan, Illinois, Pittsburgh, Pa., and Annapolis, Md., thus giving results typical of conditions in pure country air, manufacturing city air, and salt laden air on the seashore. The exposure has been for 6 or 7 years with observations taken at frequent intervals throughout the period, and the progressive corrosion of the sheets reported. In all cases the tests are continued until the sheets have failed by corrosion, so that the failure of a sheet is nothing against it except with respect to the time required for such failure as compared with other sheets.

Quoting from the 1923 Proceedings of the Society.

Page 145. "Sub-Committee III has completed its work at the Pittsburgh location, these tests being abandoned as having served their full usefulness at the close of the inspection of March 9, 1923. Attention is directed to the summary presenting in condensed form the order of resistance to corrosion for the various types of metal exposed at Pittsburgh. *It will be observed that the presence of copper in all of the various types of metal has greatly increased their resistance to corrosion under atmospheric exposure.*"

Page 150. "At the time of the March 8, 1923, inspection representing an exposure period of 71 months, 42 out of

a total of 83 of the No. 22 ga. non-copper-bearing metal sheets have been recorded as failures, whereas during the same period of exposure no single failure has been recorded for the copper-bearing metal sheet, indicating conclusively that *copper-bearing metal in the Fort Sheridan location shows marked superiority and rust-resisting properties as compared with non-copper bearing metal of the same general composition.*

Page 152. "At the close of approximately 6 years observations of these tests the sub-committee would again direct attention to the fact that the failures reported at the Pittsburgh and Fort Sheridan locations point definitely to the conclusion that *Copper-Bearing metal shows marked superiority in rust-resisting properties as compared with the non-copper bearing metal of substantially the same general composition under atmospheric exposure.*"

Due to the fact that these tests have extended over a period of years, and naturally come to a close for each group of sheets as it fails, some information in volume 22 for the 1922 meeting is also of interest. It is given herewith.

Page 153. "These failures are entirely confined to the non-copper-bearing light gauge sheets, the same groups of sheets being among the first failures at the Pittsburgh location. The light gauge sheets at the Pittsburgh locations with the notable exceptions of the copper-bearing Bessemer steel with no failures, and the copper-bearing acid Open-Hearth steel with only four failures, have completed their history, and, as might be anticipated, the heavier sheets are failing in substantially the same order as the light sheets, 70% of the non-copper-bearing sheets showing failure at the end of 64 months exposure, while no failures have occurred in the copper-bearing sheets at this time.

Page 168. "Figures 45 and 46 represent groups of copper-bearing and non-copper-bearing Bessemer steel sheets as now appearing on the Pittsburgh test rack. *It will be noted that these two groups of sheets have substantially the same general composition with the exception of the copper content.* However, the light gauge copper-bearing sheets have no failures after 64 months exposure, whereas the heavier gauge, non-copper-bearing sheets of approximately twice the thickness of the light gauge copper-bearing sheets, all failed after 24 months' exposure."

Page 168. "The table also shows the failures present in each group of sheets at all inspections, from which it will be observed that the sheets failing first at this location are confined to the non-copper-bearing metals, and belong to the same groups that failed at Pittsburgh, which development indicates that the two

different atmospheric conditions are showing the same general tendencies, only with varying rates of corrosion."

Page 170. "Table VIII, plate II, is presented as a continuation of the same general plan of grouping the sheets at Pittsburgh as shown in table XIII of the 1921 report, recording such additional failures as have occurred during the past year. It will be observed that practically all of the light gauge non-copper-bearing sheets failed after 20 months of exposure whereas only 6 of the 146 copper-bearing sheets failed at that time. *At the end of 64 months' exposure there still remains two full groups of copper-bearing sheet as well as 18 other scattered copper-bearing sheets with no failures.* The heavy gauge non-copper bearing sheet now show 87 of the total 126 sheet failed, five groups showing entire failures whereas none of the 132 copper bearing sheets have failed at this time. This information continues to bear out the conclusion of the 1921 report that *copper bearing metal in the Pittsburgh location shows marked superiority in rust-resisting properties as compared to non-copper bearing metal of the same general composition.*"

In this same volume there is a table on page 168 showing 13 failures out of 14 sheets of low copper, pure iron, made by a Rolling Mill located in Ohio and whose product is more widely advertised than any other so-called Pure Iron. The source of sheet supply is fully mentioned in the above named report.

The home owner and architect are always anxious to put up dwellings of the highest possible quality consistent with the amount of money available. One of the objects sought for has been the removal of the fire menace. The home owner can protect the actual money value of his home by insurance, but he cannot in that way, cover the inconvenience and expense of finding other living quarters during the period of rebuilding, nor can any money value be placed on the loss of treasured heirlooms or keepsakes, or on even more appalling disaster of death or injury to a member of the family.

Strictly fireproof construction, as employed in large downtown buildings, is out of the question on account of the cost. The typical American wooden frame construction will for a long time continue to be the method employed for the great majority of dwellings because of its comparatively low cost, and the familiarity gained in the use of it by builders, together with its flexibility in design and freedom from any necessity for preparing elaborate engineering drawings in advance.

A long step forward was taken when expanded metal lath was placed on the market. This metal lath consists of

sheets 2 feet by 8 feet of a steel mesh containing some 15,000 small holes or meshes to the sheet. When plaster is applied over it the mortar penetrates the mesh, bulges out on the far side, thus anchoring the plaster so securely that it cannot be dislodged. The strands of steel forming the mesh run through and through the plaster in all directions, reinforcing it and eliminating cracks. An incidental advantage gained in uniformity of color, that is freedom from the dark streaks that are so generally observable in plaster where metal lath is not used.

The Underwriters' Laboratories, Inc., whose findings are very largely used by insurance companies in establishing their rates, became interested in the matter, and after a series of tests gave what is known as a one hour rating to wood frame construction where the plastering was done over expanded metal lath. In order to gain an idea of just what this means, it may be well to say that the Underwriters' Laboratories test on which this rating is based, consists of exposing the construction for one hour and a half to a temperature of 1700, which is not enough to make the plaster glow. At the end of the hour and a half test period, a fire hose is played over the surface. The strength of the wood frame construction behind the plaster must not be dangerously impaired. For conditions as they exist in a dwelling, such a rating is to all intents and purposes fireproof. Another way to gain an idea of the improvement secured by the use of metal lath is to consider that wood lath gives protection for only four or five minutes, and several other popular types of construction only for 10 or 15 minutes.

Although the older types of expanded metal lath, thus provided the home owner with a fireproof construction without making any radical changes in the general design of a building, and at a really reasonable cost, it was still somewhat, although not a great deal more expensive than a wood lath job.

A new type of expanded metal lath known as Plasta-Saver has recently been placed on the market. In principle it adheres to the fundamentally correct idea behind the older types of lath, namely, small meshes formed by inter-connecting steel strands, but while such advantages are retained, an improvement is made by introducing flat ribs or strips of unexpanded steel sheets at frequent intervals so that instead of the entire 2 feet by 8 feet sheet of lath consisting of meshes, something less than 60% of Plasta-Saver is mesh, and the remaining 40% being a nearly flat surface through which the mortar does not pass. This brings about a great saving in the amount of mortar required to cover the lath, with a consequent reduction in the cost of the com-

plete job. Enough meshes are left to provide the firm hold on the plaster that has always been characteristic of expanded metal lath, and enough flat surface introduced to avoid unnecessary use of mortar.

The claims made by the manufacturers of Plasta-Saver seem to be substantiated by letters received from contractors actually using it, possibly the most striking one being a case involving about 3300 sq. yd. of work for which the usual quantity of plaster was ordered. 7 tons were left over when the job was finished. Other testimonials received are more general in character, but all of them in general bearing out the manufacturer's claims of economy of material and saving of labor.

---

**There is not a business one can think of, which is not full of little temples where one can curse or pray. Every business that one knows has its host of light in it, fighting against its host of darkness; one set of men conducting the business as if they and the public were engaged in a sort of mutual enthusiasm and daily service, with permanent success as the goal; and another set of men whose success is ruining the business to which they belong, and the public besides—and themselves.**

---

The other day a prominent local architect called up to inquire regarding a concern that has not advertised with us for two years. "I saw their ad. some years ago in the Guide," said the architect, "and am unable to recall just where they are located." We gave him the address and learned subsequently that as a result the firm bagged a big order. How many similar orders, from architects who wouldn't take the trouble to look them up, that same concern has missed in the course of the past two years it would interest us to know.

---

**Man and the giraffe are the only two living things that can't swim naturally. Throw a day-old kitten into the Mississippi and it will paddle its way to shore. The giraffe can't swim because he's not built that way. Man can't swim, just because he is afraid. The chances are that the reason you are not in the swim—financially or otherwise—is because you are afraid.—Glen Buck.**

---

America stands supreme in the development and use of advertising, and advertising is the seed which by implanting desire produces the fruit of social advancement. Education promotes efficiency and efficiency in turn makes possible higher earning power, higher purchasing power and improved living conditions.

## Changing an Attitude of Mind

It has been the tendency of the public to look upon insurance as something on which it must first be "sold" by convincing arguments of the insurance man.

That this attitude is undergoing a change is evidenced in the number of people who no longer wait for the agent to solicit their business but who seek out the agent and ask for insurance advice.

By its national advertising the Insurance Company of North America is helping materially to bring about that hoped for time when people will "consult their insurance agent as they consult their doctor or lawyer."

Represent North America.

## As The Editor Sees It

A new record in construction activity for the month of October was established this year, when the volume of work under way exceeded that of the same month in 1923 by some twelve per cent., according to statistics compiled by the Associated General Contractors of America. Present indications are that the total volume for 1924 will exceed the total of last year which itself registered the greatest construction output on record.

In this continued abnormal demand, which has sustained the construction equipment and material markets and utilized probably the entire supply of skilled labor since 1922, may be found an answer to the continued abnormal cost of construction. This cost during October was 101 per cent. above the 1913 average, approximately where it stood at the close of last year.

Labor rates in the principal construction centers throughout the country averaged 122 per cent. and material prices 89 per cent. above the 1913 level, indicating how much more readily the material supply may be increased to meet an abnormal program of building than can the supply of construction labor.

The present rate of construction is not only keeping pace with the demands of an increasing annual normal demand, but is also steadily wiping out the enormous post war shortage. As this shortage is finally overcome, and the construction industry moves into balance with the pres-

ent day normal, construction costs should logically move into line with the trend of costs in other industries.

Though the public has frequently been discouraged by one agency or another during the past few years from hoping that construction costs would decline, yet there is ample evidence to indicate that a gradual depression of these costs is likely. It is doubtless true that no sudden decline can result without some sort of a general business calamity, but with adjustment of the industry to its new normal annual volume, a gradual downward trend over future years seems inevitable.

### SEASONAL HOLIDAY

SO far in these columns, we have studiously avoided references to all holidays. But this month we are going to deviate from that course a bit, and ask you to consider seriously the great national holiday of Thanksgiving.

From the very nature of the word, compounded of two other very expressive words, it is readily seen that a religious significance attaches to it. At least, a religious atmosphere obtained in the early observance of the day. Just how far we have departed from the original meaning of the day is something that only the individual can answer. We are a people of many creeds and beliefs and each of us tinctures his idea of Thanksgiving with his own conception of the

meaning of the day, and so we observe it in many different fashions.

Because of these variances, many of the original features of Thanksgiving have sunk into obsolescence, and their loss has not improved the day at all.

Taking most of us as an example, it is fair to state that we're not thankful enough, not gracious enough, not courteous enough, in our daily contact with each other. We are engaged in a mighty race to capture the elusive dollar, and we thrust our way on and on with a "devil take the hindmost" air. We are too busy and too active to give much consideration to the other fellow. True, we do stop a moment and unlimber our check books for the Community Fund, but the people we help are unknown to us. We do not come in contact with them, and to thousands of our citizens the Community Fund functions like a foreign missionary society. Some few of us take a few days off, and go 'round prying others loose from cash, but it is given only to a few to come in actual contact with the people our money helps.

But because there are organizations to care for the needy, there is no excuse for us to be ungrateful, impolite, ungracious and discourteous to the immediate circle of folk with whom we come in contact. Most of us think Thanksgiving day should commemorate some huge indefinite gift for which we should be grateful, and being unable to place our finger

**DRAWING  
MATERIALS**

**CHARLES H. ROBBINS CO.**  
1729-31 Sansom Street Philadelphia  
BELL PHONE, SPRUCE 1256 KEYSTONE PHONE, RACE 3519

**BLUE  
PRINTS**

upon any huge thing that happened to us during the year, we say we haven't anything to be thankful for.

But listen to how one man solved his Thanksgiving. He reviewed in his mind the fine times he'd had with his friends during the year—luncheons, parties, golf games, theatres, dances, or evenings spent before an open fire in some one's home. Then he sat down and wrote a cheerful letter to his hosts and companions recalling the particular occasions, and expressing his appreciation for having been included in such pleasurable companionship. This gave him considerable pleasure, but can you imagine the grateful glow of appreciation that would well up in you, if, on Thanksgiving morn, a special delivery letter from a friend, expressed his joyous sentiments for the fun you and he had had during the year?

Some people, he called up, instead of writing, and he said he'd had the best Thanksgiving ever, for the people he remembered seemed so genuinely pleased to be thought of.

Contrast this with the usual experience. Thanksgiving Eve is often the scene of festive parties, from which we return in the small hours. We rise late, grumbling, and with a "rubber-boot" taste. We go to the football game, and hurry home for dinner, eat too much, play bridge all afternoon, eat again, and go to the theatre. Next day we look and feel as though we were at the wrong end of a misspent life, and look back with no satisfaction on the previous day.

Try something different this year. Think over the good things that happened to you this past year, and be thankful. If you've had a run of hard luck, be glad it wasn't worse. If election doesn't suit you, be glad it wasn't the third party that got in. Remember the old lady who got up in experience meeting and said, "I've only got two teeth, but, thank God, they hit!"

—Building Industry.

## DULL TIMES SHOW THE VALUE OF ADVERTISING

*Building Material Field Demonstrates  
How Impetus From Publicity Will  
Carry Through Period of Calm*

BY WHARTON CLAY

*Commissioner, Associated Metal Lath  
Manufacturers, Chicago.*

**T**HERE is no greater danger to an industry than to ride on the tide of prosperity. There will be a calm. In that case it can do little else than remain stationary. Unless the industry can thrive under adverse conditions, it cannot endure in a healthy state. There must be a momentum behind it that pushes it ahead even during a calm.

The old sea captain solved the problem of getting through a calm in a most natural way—by putting out more sail. If some of our industries would follow his example, dull seasons and hard times would not be so noticeable. Their method of putting out more sail would be in the form of sales promotion and advertising. To be prosperous when times are good is no small accomplishment, but to be prosperous when times are bad is quite an achievement. A vigorous advertising and sales promotion program will stabilize an industry and will work up in it a positive inertia which carries the industry forward at an ever-increasing speed, even through a dull period, in the same way that a wind-mill keeps on turning after the wind has momentarily died down.

For an industry to carry on a sales promotion campaign just before it enters into a slump is very prudent, especially if it is continued through the dull period, for when the slump is on, the industry is in a better position to command the market, and when prosperity again sets in, it is in still better position by reason of having a head start.

The year 1921 furnished an excellent example of a business calm. Business was practically at a standstill, mills were shut down, production was curtailed,

Bell Phone—Spruce 5293 1520 Sansom Street, Philadelphia Keystone Phone—Race 5555

Bridgeton High School, Bridgeton, N. J. Heated by 2 No. 15-40 Novelty Carburetor Boilers. Radiation 23,000 Sq. Ft. A direct radiator and a Universal Ventilating Unit in every class room. Soft coal burned.

*Architects: Ritter & Shay, North American Building, Philadelphia, Pa.*

*Heating Contractor: J. Howard Hutchinson, 1020 Callowhill St., Phila., Pa.*

## This Installation Led to Seven Others

A member of the Bridgeton School Board was so impressed by the service given by the boiler installed in the High School that he advised a neighboring town's School Board to specify the same make boiler. The satisfaction given by this boiler is further proven by the fact that seven other buildings in Bridgeton have been equipped with Novelty Carburetor Boilers since the High School was opened in 1923.

Soft coal is burned at the Bridgeton High School—and the top of the smokestack is the best of evidence that the heating equipment is truly a smokeless one. The smoke and gases are burned before they leave the boiler, and all that escapes up the stack is a thin mist, almost invisible. If the School Board ever desires to burn oil, or the inexpensive sizes of hard coal, the boiler will just as efficiently prevent stack wastes.

The Novelty Carburetor Boiler is fitted with patented carbureting chambers (one to each section) on the rear of the boiler. In these chambers all smoke, gases and carbon are automatically mixed with oxygen from

the air and burned. The air enters the top and bottom slots of the Carburetor, as shown in the picture. No adjustment of air intake is necessary, because the rate of combustion determines the amount of air required.

The fuel saving feature, by itself, makes the Novelty the natural selection for heating large buildings. But other Novelty features, such as the 50" water-line, which eliminates several inches of expensive excavating, and the Novelty side-feed construction, which saves boiler room space for other uses, are equally important when selecting a boiler for the years to come.

Visit our factory showroom and see the boiler for yourself; or, if you prefer, write for a list of the Carburetor Boiler installations in Philadelphia and vicinity.

For a copy of the illustrated and descriptive booklet which gives the facts about space-saving, low water line of 50", long life, and fuel saving, address Dept. BG 11.

## Proposal

TREASURY DEPARTMENT, Office of the Supervising Architect, Washington, D. C., Nov. 15, 1924.—SEALED PROPOSALS will be opened in this office at 3 P. M., Dec. 16, 1924, for new mezzanine floor, extension and alteration to lookouts, miscellaneous 1st floor changes and incidental changes in mechanical equipment, at the U. S. Post Office and Court House, Philadelphia, Pa. Drawings and specifications may be obtained from Custodian of the building, or at this office in the discretion of the Supervising Architect. Jas. A. Wetmore, Acting Supervising Architect.

## PROPOSALS

Sealed proposals will be received by the School District of the City of Easton, Pa., at the office of the Secretary, 30 North Second Street, until Monday, December 8th, 1924, 8 P. M., for the construction of a Gymnasium at the Senior High School Building and for necessary paving at the Senior High School Building at Northampton, Twelfth and Spring Garden Streets, City of Easton, Pa., in accordance with plans and specifications prepared by Messrs. Michler and Sny-

der, Easton, Pa., and on file at their office, 610 Drake Building.

Separate bids will be received for the following:

- (a) General Contract.
- (b) Heating and Ventilating.
- (c) Plumbing.
- (d) Electrical.
- (e) Paving.

Plans and specifications for the above can be obtained at the office of William M. Michler, 610 Drake Building, Easton, Pa. A deposit of fifty (\$50) dollars will be required for the use of plans, specifications, etc. Plans and specifications to be returned in good condition with bid when deposit will be refunded. All bids to be accompanied by a certified check payable to the order of the Easton School District for an amount equal to 2 per cent. of the amount of the bid submitted. Certified checks to be returned to all excepting the two lowest bidders immediately after the award of the contract. Checks of the lowest bidders to be retained until contract is signed and satisfactory bond furnished.

Proposals to be made on form provided by the architects for that purpose and addressed to the Easton School District, Attention R. E. Peifer, Secretary, 2nd and Church Streets, Easton, Pa. All bids to be sealed and marked on outside as follows: "Proposal for Construction of Gymnasium Senior High School," "Proposals for Paving at Senior High School."

The Easton School District reserves the right to reject any or all bids or part of any bid submitted.

EASTON SCHOOL DISTRICT,  
T. A. Mellon, President.

Attest:

R. E. Peifer, Secretary.

(Continued from page 740)

large stocks were unsold, inventories were high, spirits were low. In short, those were the dog-days.

They were the dog-days, however, only to those who permitted them to be. Some industries followed the example of the old sea captain and put out more sail. Their business forged ahead as though nothing had happened. Many thought this procedure would be ruinous and would prove to be a case of throwing good money after bad. Some manufacturers followed the tactics of the old seaman and profited accordingly. Some were prevented by lack of finances. Others preferred to let things take their course, hoping that some good fairy would lend a helping hand.

Let us consider how these various conditions acted with regard to building materials. From 1917 to 1921 there was a deplorable slump in building operations, with a temporary respite toward the end of 1919. The sale of building materials continued to diminish in the same proportion as building abated. There were a few exceptions, however. It is indeed a surprise to find that while the building industry was suffering adversity, two or three products not only held their own, but actually increased in sale. Conditions like this do not occur accidentally and without cause.

Charting the activities of several of

the important materials used in building, taking 1919 as a starting point, because it was the first year of domestic consumption after the war, and because towards the end of that year building operations approached nearest to normal, we find that the curves of most products are on the upward grade, with the exception of face brick. During the next year, when the slump was resumed and while other products were decidedly affected and were on the down-grade, bathroom tile and face brick were actually increasing in sales and Portland cement was not affected.

Then in 1922 and 1923, when building recommenced, the curves of these same three materials, with the addition of metal lath, shot upward in a more pronounced fashion than other materials. After due reflection and considering all the facts, this course of events is neither miraculous or unnatural. The cause is simply this—the manufacturers of these materials merely threw out more sail during the calm and stuck to the wheel. They had previously inaugurated aggressive advertising campaigns, and continued them through the dull period. Consequently their respective industries were being carried forward by the stored-up force and inertia generated by the advertising and sales promotion campaign.

They had refused to let conditions delay their progress. Instead of waiting for business to get better, they redoubled their efforts and made it better. The Portland Cement Association, the Face Brick Association and the Associated Tile Manufacturers performed wonders for their particular branches of the building industry. Excellent promotional work and increased advertising brought increased sales. This increase was by no means temporary, as the cumulative effect of their promotional work figured considerably in harvesting sales in an ever-increasing proportion after prosperity again set in.

Portland cement, considering that it is a basic commodity similar to lumber, and would therefore be greatly affected by the fluctuations of building operations, proved the best example of the benefits of trade association advertising. Ordinarily, if left alone, the sales of this product would have dropped in the same proportion as lumber, but because of its vigorous promotion by the Portland Cement Association, sales were kept from slumping. What the Portland Cement Association has accomplished is a tribute to the product. It is no wonder that the Portland cement industry, as well as other successful industries, continues to appropriate large sums for the purpose of putting out more sail to the wind.

The American Face Brick Association also has a very remarkable record. With an advertising appropriation of \$125,000 a year, the industry has shown an in-

crease of production from four per cent. below the 1913 level to seventy per cent. above this level. Although the increase in consumption may be due to the increased building after the war period, much of the credit should be given to the publicity by the association. It has been demonstrated that in many communities the building of brick houses has been increased from 100 to 300 per cent.

Of particular interest is the amazing progress of metal lath. The increased sale of this product is another example of the increasing demand for better construction, but unlike the associations mentioned above, the Associated Metal Lath Manufacturers have no definite advertising program. This kind of work is done principally by the member companies. The work of the association is of a promotional and research character. It gathers data and statistics, inaugurates tests, and in general offers material to the member companies for advertising and selling purposes. Another important function of this association is following up building codes throughout the country, for the purpose of incorporating requirements involving the use of metal lath. Thus with a small organization and a small budget, it must be given a great deal of credit for the wonderful results shown thus far.

At present the automobile industry is experiencing a dull season. However, some manufacturers are enjoying excellent business. Upon closer examination we find that the manufacturers who are least affected are those who have increased their sales effort to meet this emergency. They have succeeded in making business good for themselves. But their aggressive methods cannot make business good for the entire industry. If the industry is to benefit, it must exert itself and follow the same tactics without exception. Failure to do this invariably results in disappointment to those who lag behind, while it broadens the field to those who push themselves ahead.

The case of the metal lath industry is just another example of the same condition. Despite the rapid and steady increase in sales which was largely due to the promotional work of the Metal Lath Association and to the advertising of the separate companies, it suffered possibly the worst slump in the building field. The promotional work bore wonderful fruit when times were good, but once the slump set in there was a decisive drop in sales. The only reasonable explanation of this action is failure to stabilize industry through a vigorous advertising campaign by the industry as a whole. Promotional work is not sufficient. The lack of a well-defined advertising policy for the industry as a unit was decidedly manifest.

The advantages of trade association advertising is clearly demonstrated in the case of the common brick industry. Their

own words are more expressive in this connection than any we can think of:

"It is no secret that the common brick manufacturer stood just about knee-deep in the mud of his clay bank at the time we began advertising. He has at least climbed out onto dry land, polished his shoes and put on a collar and a cravat, and is beginning to sneak up into the front line of American business men."

The manufacturers admit that it is the wonderful stimulus they received from merely seeing "the name of common brick printed in high and expensive places" that enabled them to go after business in a more aggressive fashion. This is one lesson that has been given us by an industry that has sunk from the heights of prosperity to the depths of negligence, and is now climbing higher and higher by honest and clear-sighted endeavor toward that position in which it rightfully belongs.

The idea that business and prosperity cannot be regulated is unfounded. In many cases the so-called bad times are merely a condition of the mind. Business men strong enough to overcome this weakness are assured of success. It has been demonstrated that with the employment of proper sales and advertising policies conditions can be regulated to work to the best advantage. Perhaps it would be better for all concerned if more of our industries would follow the example of the old sea captain and put more sail to the wind.

—Class.

#### PAINT KEEPS LIME PLASTER FROM SETTING

*Should Not be Applied When Plaster is Fresh, Bureau of Standards Finds*

That oil paint applied to the surface of fresh lime plaster has a decided tendency to hinder the setting of such plaster is one of the conclusions drawn from a series of tests made by the Commerce Department's Bureau of Standards. The setting of the plaster results from the absorption of carbon dioxide from the air and the resulting change of the hydroxide, or slaked lime, into limestone.

This absorption of carbon dioxide is very greatly hampered by the paint film, the bureau finds. It is retarded, but not seriously, by a finish coat, and takes place more rapidly in lean mortars than in rich. The combination of a finish coat with a film of oil paint on top of it was subsequently tried, and was found to prevent the absorption of carbon dioxide almost entirely, cubes of plaster in this way showing no appreciable penetration of carbon dioxide after a period of six months.

In all, 144 two inch cubes were made for the test. Four different types of

lime were used, and the mortars were made in three different proportions of sand and lime. Twelve cubes were made from each mortar, of which four were left as molded, four were covered with a white finish coat and four were covered with an oil paint. One-fourth of the cubes were tested each month to determine the condition of the lime and the amount of carbon dioxide absorbed.

#### WINTER CONSTRUCTION IDEA RECEIVES BOOST FROM BUILDING MATERIAL INDUSTRY

The campaign for more building and repair work during the winter months, aimed at reducing unemployment and giving the public greater returns for the money it spends on construction, is finding much of its most energetic support from manufacturers and distributors of building materials, according to the Division of Building and Housing of the Department of Commerce. Many of the most prominent concerns in the country, as well as organizations doing a smaller business and retailers, have called attention in various ways to the advantages of winter building.

The usual let down in construction during the winter has in the past cut down retail sales, and consumption of practically all building materials, to a fraction of summer business. The uneven demand extends back to the raw products from which materials are made, and results in irregular employment and decrease in purchasing power on the part of a large section of the community. The seasonal fluctuations in railroad traffic are increased, and there is a generally upsetting influence on business and employment. The vigorous campaign for a more even building year is therefore being supported by manufacturers who are not only contributing to public education on the subject, but are working on the technical problems which concern builders in making winter work easy and economical.

The basic idea in the campaign is that all persons planning new construction or the employment of building trades workers for repairs or other purposes should take into account probable employment conditions in determining when to start the work. In this way the unemployment of building trades workers and of building material producing organizations during several months of the year is being reduced and the public is profiting.

#### HOLLOW TILE WALLS GIVEN FIRE TEST

Hollow building tile having double shells on the two exposed sides give very good results from the point of view of fire protection, the Bureau of Stand-

ards finds. The exposed shell serves as a protection for the rest of the tile, and in order to distribute the stresses properly, the webs connecting this outer shell with the inner wall of the tile should be thinner or less in number than the webs back of the inner wall.

Gypsum and Portland cement plaster coatings over hollow tile will stay in place during ordinary fire exposure and will give about the same protection from fire as the addition of one wall and cell to the thickness of the tile.

The addition of a combustible filler, such as sawdust, to the clay in amounts from 5 to 15 per cent. by volume, decreases the cracking of the burnt tile when exposed to fire, but has the disadvantage of producing a decrease in strength for the larger amounts of filler, thus lessening the ability of the tile to carry load under fire exposure.

More than 100 tests of small tile panels have been made, the panels forming one side of a special furnace. Eight tests have been made on walls 11 by 16 feet, and these are the first of a series of 50 fire tests to be conducted on hollow tile walls in the near future. Some of these walls will be tested restrained by the heavy panel frame as they would be if supported by cross walls during an actual fire. Others will be unrestrained, being supported only at the bottom. In some of the tests the walls will carry their normal working load.

Other points found to add the quality of tile are sufficiently fine grinding of the raw material, the even burning of the clay to normal hardness for that particular clay, the provision of sufficiently heavy shells and webs, and the use of ample fillets where the webs join the shell.

**Just remember this: Give out courtesy, kindness, patience and good-will, and you'll get them all back with compound interest. The men who deserve to rank in Class A do not chew the lint and fuss about the small misfits of life. To take what comes and forget the rest is wisdom. Let Braggo give the janitor the call, and the Hall Boys have it out with the Ashbox Inspector—you can't afford to soil your soul with small scraps. Fight on a big scale, or not at all. The folks who have trouble with ushers are always looking for trouble—and find it. Smile, old boy, smile!**

When you stop to consider that the Guide reaches every week and is read by architects, builders, building owners, contractors and sub-bidders in every branch of building construction, you must perceive its unique importance as a medium for advertising with an appeal to that class. Every copy reaches a live prospect.

**Many a man would do a better job if he didn't know about putty.—Ex.**

## Changing an Attitude of Mind

It has been the tendency of the public to look upon insurance as something on which it must first be "sold" by convincing arguments of the insurance man.

That this attitude is undergoing a change is evidenced in the number of people who no longer wait for the agent to solicit their business but who seek out the agent and ask for insurance advice.

By its national advertising the Insurance Company of North America is helping materially to bring about that hoped for time when people will "consult their insurance agent as they consult their doctor or lawyer."

Represent North America.

## For Permanently Hard and Waterproof Concrete

THE addition of "ANTI-HYDRO," a liquid integral compound, to the gauging water produces extremely hard and absolutely waterproof concrete all in **one operation.**

For waterproofing concrete cellars, walls, foundations, pits, stucco, mortar, etc., "ANTI-HYDRO" has no equal. It is easy and economical to use—simply mix it with the gauging water.

For 20 years "ANTI-HYDRO" has given complete satisfaction on every type of concrete hardening and waterproofing work.

## As The Editor Sees It

### KEEPING BUILDINGS DRY

By CECIL FIDLER

There is no doubt that in the past the importance of flashing in building construction has not been fully recognized. It has long been the custom to flash gutters and to use flashing at the junction of roofs and parapets, but it is only recently that designers and owners of buildings have begun to realize the necessity for flashing the entire upper and rear surfaces of exposed architectural features. It is now becoming evident that more attention must be paid to the protection of parapets and copings, the top or cornices and the floors of balconies.

An extensive examination of buildings erected in the last thirty years shows conclusively that the saturation of cornices and parapets is a very prevalent condition. In some cases the water enters at the mortar joints in the top of the coping. In other cases rain beats in and soaks in at the joints in the back of the parapet wall. Very frequently the mortar joints in the wash of the cornice are so cracked and porous that water that runs down the parapet or falls on the top of the cornice finds its way into the interior of the wall.

Many architects and owners find that they have been placing too much reliance on the mortar joints. Having procured weatherproof building materials, such as terra cotta or hard stone, and having specified mortar of tested ingredients and approved mixture, they supposed that

their buildings would be water-tight when erected. They are now finding that a great many buildings are not water-tight and on searching for the cause, they usually discover that the water is getting in at the mortar joints in the wash of the cornice and parapet coping.

At first glance it might appear that by carefully caulking or grouting the joints in the wash of cornices, parapets and balconies, it should not be very difficult to make them water-tight, but the present condition of a great many of these features proves that for one reason or another, water-tight joints are not being obtained. This condition may be attributed to a variety of reasons, as for instance, poor workmanship, poor mortar, disintegration by frost, or cracking of joints due to thermal expansion and uneven settlement.

Many kinds of elastic cement and various caulking compounds for the protection of mortar joints are on the market and some of them remain impervious and somewhat elastic for several years, but none of them appears to retain its original qualities indefinitely. Protection by means of caulking compounds involves periodical examination and considerable maintenance.

The results of poor joints are far reaching. The most common visible damage due to leaky joints in washes is unsightly staining and streaking on the face of the building. This staining and streaking is often extensive enough to destroy

the beauty of a costly building. Frequently the streaks and discolorations clearly indicate that soluble portions of the mortar are seeping out of the beds and joints and are being deposited on the face of the building. Such a condition as this, if allowed to continue, will rapidly bring about the disintegration of portions of buildings on which it occurs.

Another serious result of leakage at joints is damage to plaster ceilings and walls within the building. Cases have been known where water entering at leaky joints in the washes of cornices and parapets has penetrated the walls to the depth of several stories below, causing considerable damage to the paint and plaster on the inside of the walls.

A still more serious condition, worse because it is out of sight, is the effect of dampness on steel framework within cornices, balconies and balustrades. The presence of moisture leads to rapid corrosion of the steel members and may eventually render projecting features unsafe.

Architects and owners of buildings have also to consider the damage that is caused by the freezing of water that collects in pockets and open spaces in the interior of walls and structural features. The expansion of ice repeated through a number of winters may finally rupture the masonry.

As impervious joints are difficult to obtain and expensive to maintain and as neglected leaks result in damage to valu-

**BLUE  
PRINTS**

ale buildings, it is advisable to cover wash surfaces with an impervious and permanent coating. Sheet metal is a suitable material for this purpose.

Flashing should be carried entirely over the top of cornices and in most cases should be turned down over the nib far enough to form a drip and allow the water that runs down the wash to fall clear of the moldings. In this way the face of cornices may be kept clean and free from stains of any kind. When the top of a cornice is flashed, it is advisable to carry the flashing entirely through the base of the parapet and connect it with the cap flashing at the back of the wall. In this way water which enters at the top of the parapet is prevented from getting down behind the flashing at the back of the wall and is also prevented from getting underneath the flashing on the top of the cornice. The backs of the parapets should be flashed whenever possible and the flashing should be carried over the top of the wall, laying it in the bed joint immediately below the coping. Then, if there is any leakage at the joints in the wash of the coping, the water cannot get behind the flashing, as it often does when the flashing is applied only to the back of the wall.

The unsightly discoloration that is so much in evidence on the underside of balconies indicates the necessity for better protection of these features. It is almost impossible to make the deck of a balcony water-tight by means of a cement or tile finish. A covering of sheet metal should be used in all cases. In flashing the tops of balcony slabs with sheet metal it is necessary to run the flashing out to the nib if the best results are to be obtained. Quite frequently the floor of a balcony is properly flashed, but the flashing terminates in raglets in the base of the balustrade. This practice almost invariably results in the saturation of the balcony slab by water which finds its way in at the joints in the balustrade and runs down behind and underneath the flashing. By carrying the flashing underneath the base course, water that enters at the joints of the balustrade cannot penetrate to the balcony slab, and the soffit of the balcony is kept dry and unstained.

The washes of pediments and dormers should be completely flashed if staining and other evils of saturation are to be avoided.

While the use of sheet metal for the protection of mortar joints in washes may entail some slight additional expense at the time of the erection of the building, it will be found more economical in the end because the cost of maintenance will be avoided. Moreover, a building that is properly protected at the beginning will retain its original beauty and value.

—*Architecture and Building.*

## THE RELATION OF TILE TO ARCHITECTURE\*

Any durable material which lends itself to surface enrichment ought to be of interest to the architect.

Unfortunately many designers have not fully appreciated the possibilities of beautifying walls and surfaces. Light and shade and color and texture, it would seem, have not been fully understood. This is accounted for, at least in part, by the suggestion of a tradition that the cold gray of granite has greater dignity than a material which lends itself to warmth and sympathy and color.

For something more than a generation our architecture has been greatly influenced by the French school. Our students have returned from the Beaux Arts filled with enthusiasm and with a knowledge of planning and a freedom of expression which in earlier years was difficult to acquire in our American schools of architecture. Our own schools, however, have made great strides. Several of them now have courses which compare very favorably with the Paris school.

But our architects have, I think, been unfortunate in using the accepted French style, which is appropriate for monumental buildings, in the design of our tall commercial buildings. The architecture of New York City is, however, undergoing rapid changes. The law regulating the height of buildings, which requires set backs in the tall fronts, has already had its effect and it is destined to create the most profound changes in the appearance of this city. This, however, is only one of the forces at work. There is evidence of a new vision on the part of certain of our architects which is of even greater importance.

It is therefore possible that in the re-adjusting of architectural design there will be a gain in the feeling for color and for a decoration other than the present day architectural forms.

The manufacturers of brick have done much to meet this growing demand, in producing many beautiful shades of brick of different shapes, sizes and textures. A large number of admirable buildings may be seen all over town in which the architect has depended entirely for his effect upon the color, texture and bond of the brick to the exclusion of the usual architectural motives and ornament.

Brickwork, however, has become so expensive that owners turn to other materials. Concrete may be built more cheaply. Now, concrete, fresh from the forms, is an unlovely material but if the work

CONTEMPLATED CONSTRUCTION: ARCHITECTS AND OWNERS: COST LIMIT: LAST DAYS FOR FILING BIDS:

CHARACTER OF MATERIAL AND EQUIPMENT REQUIRED: ADVANCE INFORMATION IN EVERY PHASE OF NEW CONSTRUCTION

**Store and Apartment**, 122 West Cheltenham avenue, Philadelphia. Architect, William F. B. Koelle, Otis Building, Philadelphia. Owners, E. A. Havens Co., Land Title Building, Philadelphia. Repair to roof, carpentry and mill work, hardware, plastering, electric light, painting, plumbing, glazing (heating reserved), bond. Architect ready for revised bids.

**Residence and Garage**, Mt. Airy, Philadelphia. Architect, Charles Barton Keen, 338 South Smedley street, Philadelphia. Owner, G. Richard Nichols, care of architect. Stone, 2½ stories, slate roof, hardwood floors (heating, electric, plumbing and tile work reserved). Architect taking bids due December 2nd at noon.

**Residences (14)**, North side Buist avenue, West of Sixty-fourth street, \$4,500. Architect, private plans. Owners, Mench & Manley, Fifty-ninth and Cedar avenue, Philadelphia. Brick, 2 stories, 15x27 feet, 11x11 feet, slag roof, hardwood and pine floors, electric lighting. Owners will build.

**Library**, Nineteenth to Twentieth, Vine to Wood streets, Philadelphia. Architect, Horace Trumbauer, Land Title Building, Philadelphia. Owners, City of Philadelphia, care of Librarian, Thirteenth and Locust streets, Philadelphia. Library, completion. Plans in progress.

**Grading and Paving**, Philadelphia. Owners, Department of Public Works, Bureau of Highways, City Hall. Asphalt paving, grading, country road improving, asphalt sand, crushed pebbles, asphaltic concrete. Owners taking bids December 2nd at noon.

**Building**, Northeast Corner Nineteenth and Arch streets, Philadelphia. Architect, not yet selected. Owner, J. C. Kahn, Morris Building, Philadelphia. Reinforced concrete, steel, 15 stories. Work contemplated.

**Sales and Service Station**, 4630 North Broad street, Philadelphia. Architect, Edward A. Roth, Drexel Building, Philadelphia. Owners, Logan Motor Co., care of J. J. Kaufman, 4632 North Broad street, Philadelphia. Brick, 2 stories, 20x100 feet, steam heat, electric light, slag roof, cement and plank floors. Plans in progress.

**Senior High School**, Fifty-ninth and Lancaster avenue, Philadelphia. Owners, Board of Education, Nineteenth above Chestnut street, Philadelphia. Reinforced concrete,

brick, steel. Plans completed. Owner ready for bids in 2 weeks.

**Store and Apartment (alts. and add.)**, 2922 Ridge avenue, Philadelphia. Architect, William L. Charr, 149 South Fourth street, Philadelphia. Owner, Harry Schwartz, on premises. Brick, 3 stories, 16x70 feet, electric light, metal lath, tile work, store fixtures, bond, metal bulks. Architect taking bids.

**Garage**, 19-21-23 Bittenhouse street, Philadelphia. Architect, J. Ethan Fieldstein, Otis Building, Philadelphia. Owner, name withheld. Brick, 1 story, 60x170 feet, slag roof, cement floors, electric light. Plans in progress.

**Garage**, Lombard street, East of Twenty-first street, Philadelphia. Architect, J. Ethan Fieldstein, Otis Building, Philadelphia. Owner, name withheld. Brick, steel, 3 stories, 68x162 feet, slag roof, cement floors, plank floors, steam heat, electric light, rolling steel sash, concrete ramps. Plans about completed.

**Factory**, 4841 Lancaster avenue, Philadelphia. Architect, Amos W. Barnes, Perry Building, Philadelphia. Owners, Brooks Brothers, on premises. Brick, slow burning, 3 stories and basement, 60x100 feet, slag roof, maple floors, steam heat, electric light. Plans in progress. Architect will be ready for bids in two weeks.

**Residence**, Seventh and Cheltenham avenue, Oak Lane, Philadelphia. Architect, Conrad F. Neff, Twelfth and Locust streets, Philadelphia. Owner, H. E. Brooks, Huntingdon and Hancock streets, Philadelphia. Stone, 2½ stories, 27x50 feet, slate roof, hardwood floors, hot water heat, electric light, tile work. Plans in progress. Ready for bids in two weeks.

**Garage**, Master and Wellington streets, Philadelphia. Architects, Newbauer & Supowitz, 929 Chestnut street, Philadelphia. Owner, M. Kirschner, 4930 Brown street, Philadelphia. Brick, 2 stories, 50x200 feet, slag roof, cement floors, steam heat, electric light. Owner will build.

**Garage**, 2831 West Susquehanna avenue, Philadelphia. Architect, I. W. Levin, 1011 Chestnut street, Philadelphia. Owner, J. Powell, care of J. J. Fisher, Fourth and Morris streets, Philadelphia. Brick, 1 story. 70x120 feet, slag roof, cement floors, steam heat, electric light, rolling steel sash, flush bulks, plate glass. Owner taking sub-bids.

**Apartment Buildings (5)**, Germantown, Pa. Architect, Louis J. Tunis, 1423 Locust street, Philadelphia. Owner, Weiss Kaplin, Bankers' Trust Building, Philadelphia. Stone, 2 stories and basement, 38x63 feet each, slag and sheet metal roof, hot water heat, electric light, metal lath, tile and marble work, mill work, hardwood floors, cement, concrete work, garages in basement. Architect and owner taking sub-bids due as soon as possible.

**Residences (23)**, Hunting Park avenue and N street, Philadelphia. Architect, J. J. Carroll, 1619 Chestnut street, Philadelphia. Owner, F. P. Dougherty, 1936 East Passyunk avenue, Philadelphia. Brick, cut stone, stone, 2½ stories and 2 stories, 74x29 feet, garage 21x23 feet (plumbing, heating and electric reserved), shingle roof, oak, pine and cement floors, metal lath, steel casement sash, bond, ornamental iron work. Contract awarded A. W. Hopeman & Son, Ardmore, Pa.

**Residence (alts.)**, Cynwyd, Pa. Architect, Norman Hulme, 1524 Chestnut street, Philadelphia. Owner, Frank E. Baker, on premises. Brick work, carpentry and mill work, painting and glazing, electric work, hardware, hot water heat, plastering, slate roof repairs. Contract awarded Rudolph Lukens, Cynwyd, Pa.

**Residence**, No. 559, Haverford, Pa. Architects, McIlvaine & Roberts, Otis Building, Philadelphia. Owner, name withheld. Brick, stone, cinder concrete block, 2½ stories, shingle roof, oak and pine floors, vapor heat, electric light, metal lath, tile work, metal weather strips, bond, dampproofing, ornamental iron work, iron pipe. Contract awarded Metzger, Fisher & White, Otis Building, Philadelphia.

**Garage**, 161 Greenwood avenue, Wyncote, Pa. Architect, private plans. Owner, Horace Beck, on premises. Stone, 1 story, 20x20 feet, shingle roof, cement floors, heating and lighting extensions. Contract awarded Hood & Gross, 1613 Chestnut street, Philadelphia.

**Residence (alts.)**, 211 East Third street, Lewistown, Pa. Architect, George S. Idell, 1705 Chestnut street, Philadelphia. Owner, P. F. Lytle, Lewistown, Pa. Alterations to front, frame, brick work, wood shingle roof, mill work. Contract awarded W. D. Steinbach, Smith Building, Lewistown, Pa.

**Factory**, Ninth street, between Pike and Amuta streets, Reading, Pa. Architect, private plans. Owners, Dye Casting Co., Reading, Pa. Brick, steel, frame, 1 story, 60x150

feet, slag roof, cement floors, wood blocks. Contract awarded H. E. Baton, 1713 Sansom street, Philadelphia.

## New Jersey Construction News

**Bank Building**, Hammonton, N. J., \$85,000. Architects, Simons, Brittain & English, 929 Chestnut street, Philadelphia. Owners, People's Bank of Hammonton, W. J. Smith, Hammonton, N. J. Probably brick, 1 story. Plans in progress.

**Residence and Garage**, Bridgeton, N. J. Architect, Thomas Edward Ash, 1012 Walnut street, Philadelphia. Owner, Robert Moore, Jr., 214 North Pearl street, Bridgeton, N. J. Hollow tile and stucco, 2½ stories, 45x50 feet, tile roof, hardwood floors, vapor vacuum heat, electric light, tile and marble work. Plans in progress.

**Store and Apartments (4)**, Collingswood, N. J. Architect, R. R. Neely, 2301 Spruce street, Philadelphia. Owners, R. R. Neely and Corson M. Shallcross, Windrim and York Road, Philadelphia. Brick, limestone fronts, cement blocks, 2 stories, 16x60 feet, slag roof, hardwood floors, hot water heat, electric light, tile work. Architect taking sub-bids due at once.

**Residences (2)**, Parkway avenue, Trenton, N. J., \$12,000. Architect, private plans. Owner, H. J. Barnett, 109 West Hanover street, Trenton, N. J. Brick, 2½ stories, 20x30 feet, slate roof, hardwood and pine floors, hot water heat, electric light. Owner will build.

## New Jersey Contracts Awarded

**Buildings**, Delair, N. J. Architect, private plans. Owners, Kierfhefer Container Co., Delair, N. J. Brick, steel, slag roof, gypsum roof, beater building, 2 stories, 80x90 feet, machinery room, 1 story and basement, 334x45 feet, concrete floors, rolling steel sash, monitor skylights. Contract awarded Irwin & Leighton, 126 North Twelfth street, Philadelphia.

**Church**, Millville, N. J. Architect, Thomas Edward Ash, 1012 Walnut street, Philadelphia. Owners, Trinity A. M. E. Church, Millville, N. J. Frame, 1 and 2 stories, 28x60 feet, slate roof, pine floors, mill work, hot air heat, electric light. Contract awarded George Maier & Son, Bridgeton, N. J.

**Residence**, Virginia avenue, Trenton, N. J., \$27,000. Architect, private plans. Owner, George W. Briel, 76 Liberty street, Trenton, N. J. Brick, frame, 2½ stories, 28x34 feet, hardwood and pine floors, electric light, hot water heat, tile work. Contract awarded to G. Roman, 108 Virginia avenue, Trenton, N. J.

**Residences (2)**, Genesee street, Trenton, N. J., \$8,550. Architect, private plans. Owner, Samuel Rednor, 22 Roebbling street, Trenton, N. J. Brick, frame, 2½ stories, 22x41 feet, hardwood and pine floors, electric lighting.

Contract awarded to J. R. Longevin, 358 Brunswick street, Trenton.

**Residence**, Parkside avenue, Trenton, N. J., \$7,000. Architect, private plans. Owner, Caroline Bebbington, 866 Parkside avenue, Trenton, N. J. Frame, 2½ stories, 22x23 feet, hardwood and pine floors, hot water heat, electric light, tile work. Contract awarded to H. Bebbington, 866 Parkside avenue, Trenton.

**Residence**, Kirkbride street, Trenton, N. J., \$4,750. Architect, private plans. Owner, Albert Pepsyok, care of builder. Frame, 2½ stories, 16x42 feet, electric lighting, hardwood and pine floors, hot water heating. Contract awarded to W. Pace, 1200 Prospect street, Trenton, N. J.

**Store (alts. and add.)**, 14 Pennington street, Trenton, N. J., \$3,500. Architect, private plans. Owner, Isadore Levin, Princeton and Pennington streets, Trenton, N. J. Brick, 1 story add., 16x16 feet, general alterations. Contract awarded to Gemaro Panne, 744 Roebbling street, Trenton.

**Garage**, Market street, Trenton, N. J., \$3,000. Architect, private plans. Owner, Dora Cooper, care of builders. Concrete block, 1 story, 40x50 feet, slag roof, concrete floors. Contract awarded to Ungaro & Shindel, 121 Jackson street, Trenton.

**Residence**, 361 North Thirty-fourth street, Camden, N. J., \$3,800. Architect, private plans. Owner, Mrs. Drucella Brown, 360 North Thirty-fourth street, Camden, N. J. Frame, 1½ stories, 24x30 feet, slate surface roof, hardwood and pine floors, warm air heat, electric light. Contract awarded to Thomas C. Tolbert, 99 North Forty-sixth street, Pensauken, N. J.

**Service Station**, Southwest Corner Ferry and Atlantic avenues, Camden, \$1,600. Owners, Garden State Oil Co., 1500 Broadway, Camden, N. J. Concrete block, 1 story, 12x20 feet, slate surface roof, cement floors. Contract awarded to J. D. Hill, 117 Chestmont avenue, Collingswood, N. J.

## Miscellaneous Construction News

**Residence**, Winston Salem, N. C. Architect, Charles Barton Keen, 338 South Smedley street, Philadelphia. Owner, Carl W. Harris, Winston Salem, N. C. Hollow tile and stucco, brick and whitewashed, 3 and 2½ stories, tile roof, hardwood floors, electric light. Plans in progress. Ready for bids in two weeks.

**Bakery**, Brooklyn, N. Y. Architects, Seeburger & Rabenold, 1524 Chestnut street, Philadelphia. Owners, Drake Bakeries, Inc., Brooklyn, N. Y. Reinforced concrete steel, 5 stories, 80x84 feet, slag roof, cement floors, steam heat, electric light, elevators, rolling steel sash. Architect taking bids due November 29th.

**Stores and Offices**, Jane street and Crescent street, Long Island City, N. Y. Architects, The Ballinger Co., Twelfth and Chestnut streets, Philadelphia. Owners, N. S. Holding Corp., New York City, N. Y. Brick, granite, concrete steel, terra cotta, 5 stories, 100½x80½ feet, steam heat, electric light, tile work, slag roof, concrete floors, elevators, kitchen equipment, ornamental iron work. Architects taking bids at the New York Office, due November 28th.

(Continued from Page 756)

is done with care and the surface properly treated, good looking structures may be produced.

The use of the usual architectural embellishments such as cornices, quoins, lintels and keystones are meaningless in concrete. If the designer is tempted to use them the present high cost due to the difficult form work should have a corrective influence.

"But," you are saying, "what has the design of office buildings got to do with the selling of tile?" Just this: certain of the more original architects, in throwing overboard the old forms, will be on the outlook for color; and another class of architects, a little less bold, may perhaps be persuaded to use color if the matter is properly presented.

Your men may say to these architects: "If you will use this material, you can get any color you want. You may have your color in large effective areas or you may

arrange it in fine delicate patterns. You may have a rich line of color to take the place of your overworked cornice, or a plaque to replace the cartouche. If you wish the effect of shadow, here is a black tile. If you wish to express gayety, here are bright yellows, blues, greens and reds. If you wish to decorate your concrete building, here is an appropriate material."

If the architects tell you your tile have not sufficient brightness or depth of color then go to the chemists in your factories and demand the colors the architects want. But if you take your dust pressed or your machine made tile to the architect and persuade him to use them in exterior work here in our rigorous climate, then you will have done him and the tile business a wrong and your sins will be on your own head.

I have spoken of the exteriors of our buildings rather than the interiors. A certain simplicity is, however, noted in the interiors designed by our better architects. One notices with great pleasure large simple rooms with stuccoed walls, beamed ceilings and graceful arched openings devoid of trim. In these fine new houses, your beautiful hand made tile need not be restricted to the bath. It is eminently fitting and proper that semi-exterior adjuncts which add so much charm and comfort to the home, the sun rooms, verandas, pergolas, be furnished forth in tile. I can imagine no more beautiful or appropriate floor for the main hall of a large house than one executed in well designed hand made, colored tile.

The same principle of simplicity is, I think, applicable to the use of faience. The danger in the use of this material lies in the fact that it is possible to imitate the usual forms of wood or stone. Designers in faience would do well to work with greater freedom and depend upon color and modelling in low relief rather than employ the familiar architectural motives and details.

I have held forth on the appropriateness of hand made clay products as a surface decoration and I have suggested the possibility of its wider acceptance by the more progressive architects. To assure yourselves of larger business, each producer of tile should be certain that he has a product which will resist disintegration. Every now and then a tile man presents himself at my office with a machine made or dust pressed tile and assures me that it is weatherproof and, of course, I have to tell him that it cannot be approved. This is bad business

because one must conclude that the man is either dishonest or grossly ignorant of his own product. My experience leads me to believe that the best results are obtained from hand made, wet pressed bodies which have but a slight porosity. Each of those factories which have not already done so, should make the necessary tests to be absolutely sure that its product will stand up under extreme conditions; and the best test, in my opinion, is to set the tile in a wall where it will be exposed to the winter's wet and cold. I have but little faith in laboratory tests.

There has been difficulty in the past in getting bright reds, yellows and oranges. Some years ago a man brought me an elaborate palate of mosaic samples neatly set up on a board. On examining them, I found that he had every shade of lavender, violet and purple known to the world and little else. When I asked him about his reds, yellows, oranges, blues and greens, like the "rich young man" of the scriptures, "he went away sorrowing." Certain of the factories, I am glad to say, are now giving us much better color than we were able to get a few years ago.

I mention these incidents, to which I could add many more, as examples of bad salesmanship which does the tile business an incredible amount of harm. The salesman must know his material, he

must represent it honestly and he must give the architect what he wants if he would serve the tile business well and adequately.

Our artists and architects, caring less for cold, formal representation, seek rather power in mass, significance in line and joy in color; if the producers of burnt clay are able to catch the spirit of the time, they may place in the hands of the architect a product which will bring joy and color and beauty to the shop and offices and to the hearth and home.

—*Architecture and Building.*

## QUANTITY TAKE OFF IN THE PLUMBING TRADE

By ARCHIE F. BOYD, of *Granite City*

A correct method of estimating will greatly increase the efficiency, also the profit of builders in the industry, and eventually lower the cost of building to the public.

In estimating Plumbing, there are various methods of estimating and it is not for me to state which of these methods is the best, but I do know that, any one method of those available, is based on somebody's experience and is a far better method than that of guessing; furthermore, it you will get accustomed to one particular method, you become thoroughly familiar with it and then you will have less opportunity of forgetting various items, which has been proven so disastrous to contractors in this phase of contracting.

In estimating quantities, I find from experience that, it helps me to have what I term a "Quantity Sheet" this being a blank sheet with lines on the top for the name and address of the owner, name of architect, date, job number, scale, depth of basement, depth of sewer in alley. It is proper to scale off the basement, first floor and second floor, showing the basement work on the basement plan, including the sewer and showing the locations of the fixtures on the others; then in a rough way draw a diagram of the various bends and fittings, you can describe the various stacks separately and take off this quantity of all material going into the wastes and vents, including all soil pipe, soil fittings, lead, solder, joints, ferrules, caulking lead, etc.

After this the various amounts should be transferred to the tabulating sheet.

These are ruled on top the same as on the Quantity sheets, providing space for name and address of owner, architect, number of sheet and such other items as for instance, water pipe, flashings, drum traps, gasoline, candles, lead, oakum, and in fact all items that enter into this phase; then transfer these totals to your estimating sheet; the next proceeding, of course, is the pricing up of the various articles including the fixtures.

The question of estimating labor is undoubtedly an uncertain item. Without fear of contradiction—that item has caused more failures and the greatest losses, in not only the plumbing trade but in all the building trades. It represents a serious hazard that is not sufficiently appreciated. Some estimate labor according to the accomplishments of their best men; some according to their fastest men; some according to the time they themselves could install the work. In the first place, during a busy season, you find it necessary to employ extra men; naturally, they will not perform the same amount of work your regular men perform; neither can you expect the men you hire to work as honestly and diligently for you, as you would for yourself. Therefore, you are not fair with yourself. You are giving the owner more than he is entitled to and more than he expects. Owners want you to make a fair and reasonable profit. If you underestimate the labor on his job and that becomes evident on your record sheet as the job progresses, naturally, it will have a tendency to cheapen your work or avoid some items in order to permit you to break even. No one willingly shoulders a loss if it can be avoided. Therefore, it is essential that some standard of estimating labor should be used.

Now gentlemen, here is the labor formula I use after a careful study of same. I cannot, of course, vouch for its accuracy in the various sections, but I found it a great help to me.

Sewer work up to and including—  
5 ft. deep, 8 cu. yds. per day.  
6 ft. deep, 7½ cu. yds. per day.  
7 ft. deep, 7 cu. yds. per day.  
8 ft. deep, 6½ cu. yds. per day.  
9 ft. deep, 6 cu. yds. per day.  
10 ft. deep, 5½ cu. yds. per day.  
11 ft. deep, 5 cu. yds. per day.  
12 ft. deep, 4½ cu. yds. per day.

## Water Pipe

¾ to ½ inch 100 ft., installed per day.  
¾ inch, 90 feet installed per day.  
1 inch, 75 feet installed per day.  
1¼ inch, 60 feet installed per day.  
1½ inch, 60 feet installed per day.  
2 inch, 60 feet installed per day.  
Larger, 50 feet, installed per day.

The cost of fittings equals 30 per cent. of the cost of the pipe, either black or galvanized.

Soil pipe work will vary but the average journeyman will run and caulk 50 lbs. of lead per day, so in determining the amount of lead required on the entire job, divide by 50 and that will give you a very good estimate on the labor. However, I have also used on ordinary jobs.

35 feet of 4 inch per 8 hour day.  
50 feet of 2 inch per 8 hour day.

On lead work—1 joint per hour.

Gasoline is 1 gallon to 5 wiped joints.

Gasoline is 1 gallon to 25 lbs. of caulk lead.

Solder—1 lb. to the joint up to 2 inches.  
Over two inches—1 lb. to the inch.

Pipe Covering—75 ft., per 8 hour day including fittings up to 2 inches, and 60 ft., per day from 2 to 4 inches; 40 ft., per day from 4 inches to 6 inches.

Durham Work by hand: 4-6 inch Cuts and Threads made up; 5-5, 6-4, 7-3, 10-2, 12-1½, 15-1¼. Twice this amount if power utilized.

On Durham Vent Work: 1¼-1½-2 inch, 60 ft., per day installed. Larger, 50 ft., per day installed.

This also includes Fire Lines for setting hose racks, one hour each. Setting fixtures, considering that waste and vents have been run through walls and floors, ordinary fixtures 4 to 8 hour day; large fixtures over 300 pounds, require helpers according to their weight. It is false economy to try and think a man can lift and handle all fixtures by himself, as quite often, regardless of how careful he may be, an accident may happen which spells only one thing—"EXPENSE."

Another item of expense is truck service and I find it will cost you 50 cents every time your truck delivers anything to a job, provided it is not over two miles; therefore, it is good practice to educate your men to either phone in or give the foreman or wagon man their order in the evening and at noon. This will eliminate numerous unnecessary trips that spell—"EXPENSE."

Now, I do not say this is the best system nor do I claim this is guaranteed perfect in your own locality, but, I do claim, this is about the best I can find from experience of 18 years in my locality, of course, the contractor will also have to be governed by judgment as well as conditions vary, but if you will adopt the above

rule and check same with your actual jobs, and in case you have any variations, change and apply your figures to fit your condition, I am confident, it will greatly increase and enlarge the little word that appears on the bottom of your estimate slip with but six letters in it, namely—"PROFIT."—*Associated Building Contractors of Illinois.*

## ESTIMATING HEATING INSTALLATION

By WM. BERGNER of Granite City.

Many factors enter into compiling labor costs on the installation of Heating systems and the various systems, such as One Pipe Steam; Two Pipe Steam; Vapor; Gravity Hot Water; Pressure or Closed Hot Water Systems; One Pipe Hot Water System; Fan System, etc., each present their individual problems.

The system specified in the plan and specification in this program is that of Vapor System and I will of course confine my entire analysis of estimating to that system. The quantity of materials entering into this heating plant, I will not discuss because of lack of time.

Before proceeding in stating the actual time required for this job, it is necessary to explain how we can determine what is the correct amount of time to estimate. Obviously of course, we cannot, accurately, state the exact time that will be required, but I will present what conditions and experiences have taught us to consider in determining as nearly as possible, the time that will be required.

In estimating work, the time is based on a number of conditions; the period of year in which the work will be installed—the efficiency and capacity of the organization employed—the condition of the market, relative to the amount of construction work under headway—and the amount of heating business contracted for.

There are times when it is necessary to figure 14 hours per radiator for a particular kind of installation, and other times, when but eight hours estimate is sufficient for the same installation. With a regularly employed force of Steam Fitters and with sufficient business to keep them steadily employed, the contractor can figure nearly correctly so far as labor time is concerned. If your working force fluctuates during the various seasons of the year, and half the year you employ ten or twelve teams, and the balance of the year but three fitters, it is essential that that be taken into consideration.

These conditions exist throughout the country. In one territory you will find it requires 25% to 50% more time to perform a given amount of work than in another territory. It entirely depends on the various labor agreements entered

into, the working rules in effect, also the efficiency of labor in the various territories.

It is poor policy and should be guarded against, to estimate labor on the basis of time a rapid man in your organization can perform it. If you secure contracts that will occupy the time of your best laborer and require the employment of additional labor, you will find that the time estimated will not be sufficient. The additional cost of labor may more than just wipe out your entire margin of profit expected.

It is always a sane and safe rule to estimate labor on what experience shows to you to be an average labor requirement. This really is insurance against loss on jobs where more time is required than was estimated.

Why should the contractor be the sole gambler on a job? It is but proper that the owner should be required to shoulder, to assume part of the risk. When a contractor estimates labor on a basis of average time required for a given performance, each of the principals assumes his share of the risk and responsibility.

As to the time required on the particular job considered in connection with this program, we find a total of 26 radiators plus 3 radiators on the third floor to be roughed in. We have 3 ceiling radiators in the basement 11 leg and 1 small wall radiator on the first floor, 9 leg and 1 wall radiator on the second floor, and 1 wall radiator in the garage set a distance of 18 feet from the boiler room.

With my present organization, considering the season of the year and the volume of business on hand my estimate of labor for the installation of these radiators aggregates a total of 304 hours or 38 days for a steam fitter and helper. Plus one day's time for digging trench to garage. Following is my tabulation of time that will be required based on cutting all pipe on the job:

20 leg radiators, 10 hours each—200 hours.

3 wall radiators, 12 hours each—36 hours.

3 ceiling radiators, 13 hours each—39 hours.

3 radiators (Roughed), 8 hours each—24 hours.

Additional piping in trench to garage. 5 hours.

One day time for labor, digging trench, refilling and installing split tile.

For buildings of different construction, the time as estimated, probably would not be sufficient. For instance, reinforced concrete job with large size wall or ceiling radiators. Such a job would require added consideration for the assembling and installing of hangers, drilling walls for expansion bolts, working on scaffolding, setting sleeves and in-

sets, or having more or larger size pipe to handle per radiator.

The size of boiler and the boiler room equipment must all be estimated separately.

The study of labor cost on heating installations, has not been considered to the extent that it should have been. If it had, we would not have the million and one complaints from contractors, whose grief was that not sufficient time of labor had been figured on. **THIS ONE POINT SHOULD BE DEEPLY IMPRESSED ON YOUR MIND.**

Who really is responsible for the high cost of labor? Is it the journeyman? From my point of experience, I am satisfied that 50 per cent. of the blame falls to the heating contractor himself. You inquire how I arrive at this conclusion? I'll tell you.

Labor is frequently inefficient because too many of their employers are inefficient.

Employers fail to supply the proper class of supervision on jobs.

Employers provide poor grade of tools; wrong materials or insufficient material, and generally, poor co-operation.

### A Remedy

Contractors can remedy and avoid many of the labor difficulties if they will endeavor to right conditions on their side.—*Associated Building Contractors of Illinois.*

Examples of noteworthy architectural achievements on the part of Trenton members of the architectural profession as well as displays placed by Trenton dealers in building materials made up the first architectural and building exposition which was held at the Stacy-Trent Hotel in Trenton last week.

Through this exposition as well as through many others that the architects of Trenton are planning to hold, the architects hope to familiarize the public with the advantage of having an architect design and superintend construction of properties and to make clear to the public the reasons why an architect's service is essential to the best interests of builders.

The displays at the exposition included photographs and drawings showing Trenton buildings either erected or contemplated.

Plans for the proposed Soldier's and Sailor's Building at Trenton, designs for the new Masonic Temple, new schools and many beautiful homes planned by Trenton architects were exhibited. A model of the State Hospital for Insane at Morris Plains, N. J., was an attractive feature of the exposition.

## Changing an Attitude of Mind

It has been the tendency of the public to look upon insurance as something on which it must first be "sold" by convincing arguments of the insurance man.

That this attitude is undergoing a change is evidenced in the number of people who no longer wait for the agent to solicit their business but who seek out the agent and ask for insurance advice.

By its national advertising the Insurance Company of North America is helping materially to bring about that hoped for time when people will "consult their insurance agent as they consult their doctor or lawyer."

Represent North America.

## As The Editor Sees It

### DUTIES OF EACH CONSTRUCTION ELEMENT

BY CHARLES T. MAIN,  
*Engineer, Boston, Mass.*

IN discussing this subject, I shall refer only to engineers, and to work customarily designed by engineers, leaving out the word "architect." The same general principles should apply to work customarily designed by architects.

The more important elements which make up the construction industry are the owner; the engineer and his organization; the constructor and his organization of superintendents, engineers, accountants, etc.; the workmen, skilled and unskilled; and the group supplying materials, which also is made up of complex organizations. For the purposes of construction, these groups are interdependent, and their interests are the same, since the depression or expansion of the industry affects them all in the long run.

#### *The Owner's Control*

The owner group is the only element of the construction industry which has within its power much control over the volume and regularity of construction. As a whole, it has control over the volume of construction and the time when it is undertaken. The owner group includes individuals, and private and public corporations. This group is primarily responsible for the regulation of the activities of the building industry.

It has been shown conclusively that an

increase in the volume of construction in any community is immediately followed by an increase in the cost of construction, both materials and labor increasing, and it must not be forgotten that about 90% of materials represents labor in some form; and that a decrease in volume is followed by a decrease in cost. Wide fluctuations in cost bring reactions in turn on the volume of construction and affect the employment problem.

This condition is probably not clearly realized, and when it is realized by all the elements of the industry, greater stability will result. Statistics which show the facts should be of great help in this respect. In almost every walk of life, people are apt to follow each other like sheep. If one builds, another thinks that he must build.

As a general rule, the owner element may be classed as the least skilled element of the building industry, since it has usually had little contact with the details of the industry itself. It is, therefore, doubly important to make clear to this group some of the fundamental problems which it affects.

The owner who undertakes a piece of engineering construction is responsible for the selection of the engineer to translate his general requirements into definite plans and specifications so that the constructor and his forces may do the construction. In selecting his engineer, the owner should give consideration to the engineer's breadth of experience, quali-

fications of the engineer and his organization for the particular type of work, reputation for fair dealing with both owners and constructors, and his ability to get his work done expeditiously. If possible the engineer should be called in the initial stages for general advice on the feasibility of the undertaking.

The owner or the engineer, or usually both, is responsible for the selection of the constructor or the list of bidders. In making such selection, consideration should be given to the skill, integrity and responsibility of the constructor and his organization, his experience for the particular type of work, reputation for fair dealing, and his ability to complete the work on time.

If these precautions are followed, a list of bidders will be selected who will be on about the same footing, and fair competition can be secured. No constructor should be asked to bid because of friendship only, or as a matter of expediency.

Owners should realize that there is considerable variation possible in the character and cost of construction, even under the most definite plans and specifications and careful inspection, due to the attitude and ability of the constructing organization.

Owners of large experience in building place greater stress on having their work done by engineers and constructors of good reputation than do owners of less experience.

**DRAWING  
MATERIALS**

**CHARLES H. ROBBINS CO.**  
1729-31 Sansom Street Philadelphia  
BELL PHONE, SPRUCE 1256 KEYSTONE PHONE, RACE 3519

**BLUE  
PRINTS**

The owner should carefully study the general plans and specifications and agree with the engineer on the general features of the work. It is important that all changes should be made on paper and as few changes as possible made after the contract has been let, as they are costly in both time and money.

Payments should be made when due, so that the constructor may not be obliged to carry more financial responsibility than he anticipated.

The owner's responsibility does not cease with the selection of engineer and constructor. The results of his undertaking, if it is any more than of a private nature, may be far reaching. If it be properly for rental, the rents may have to be excessive if the cost is too great; or if it is a manufacturing enterprise, fixed charges may be too high; or if it be a public building, the general public must pay more taxes. Also, if he can do anything to stabilize the building industry, he will be helping the workmen and the community.

#### *The Engineer's Role*

Some of the important responsibilities of the engineer have been mentioned in the foregoing. He should be familiar with the conditions surrounding his problems. If it is a manufacturing plant he is designing, he must familiarize himself with the manufacturing processes so as to suitably arrange the machinery and processes for economical installation and operation, and make the structure fit them as simply as possible. He must be familiar with the physical properties of building materials, their availability and cost. In these days of large complicated jobs involving several different branches of engineering, it is important that an engineer who is carrying on such general work should have an experienced organization qualified to cover the several branches.

The plans and specifications of the engineer should be clear and complete and fully describe the work to be done and all the known conditions surrounding it.

There is a wide variation in the amount of service rendered in this respect. Ambiguity and incompleteness in plans lead to higher construction costs and less satisfactory results. The engineer should not expect the various sub-contractors to make plans which should be made by him.

The contracts should be carefully drawn and a type of contract selected which will be fairly applicable to the work to be done. Not all jobs may advantageously be done under a lump sum contract. When the extent of the work is not definite, or when the risks are uncertain, or the time required will be long, the work can generally be more advantageously done under some other form of contract. In some cases lump sum contracts should not be used.

The movement to get a uniform set of contract documents drawn by the several elements of the industry, adopted for general use, is a good one, and deserves to succeed.

In dealing with the constructor, the engineer should be careful not to interfere with the functioning of the constructor's organization on that part of the work where the constructor is solely responsible, but he should be as helpful as possible without becoming involved in what is properly the function of the constructor.

#### *Often Arbitrator*

The engineer will frequently find himself in the position of an arbitrator between the owner and the constructor, and sometimes his own work may be subject to criticism. On such occasions he must be fair and courageous and just in his decisions, even though he himself may suffer.

The engineer should be willing to discuss methods or details with the constructor whose experience in certain lines may be more extensive than the engineer's. He can adopt suggestions or not, as may seem wise.

#### *The Constructor's Work*

The qualifications and responsibilities  
(Continued on Page 783)

Bridgeton High School, Bridgeton, N. J. Heated by 2 No. 15-40 Novelty Carburetor Boilers. Radiation 23,000 Sq. Ft. A direct radiator and a Universal Ventilating Unit in every class room. Soft coal burned.

Architects: Ritter & Shay, North American Building, Philadelphia, Pa.

Heating Contractor: J. Howard Hutchinson, 1020 Callowhill St., Phila., Pa.

## This Installation Led to Seven Others

A member of the Bridgeton School Board was so impressed by the service given by the boiler installed in the High School that he advised a neighboring town's School Board to specify the same make boiler. The satisfaction given by this boiler is further proven by the fact that seven other buildings in Bridgeton have been equipped with Novelty Carburetor Boilers since the High School was opened in 1923.

*Soft coal* is burned at the Bridgeton High School—and the top of the smokestack is the best of evidence that the heating equipment is truly a smokeless one. The smoke and gases are burned before they leave the boiler, and all that escapes up the stack is a thin mist, almost invisible. If the School Board ever desires to burn oil, or the inexpensive sizes of hard coal, the boiler will just as efficiently prevent stack wastes.

The Novelty Carburetor Boiler is fitted with patented carbureting chambers (one to each section) on the rear of the boiler. In these chambers all smoke, gases and carbon are automatically mixed with oxygen from the air and burned. The air enters the top and bottom slots of the Carburetor, as shown in the picture. No adjustment of air intake is necessary, because the rate of combustion determines the amount of air required.

Visit our factory showroom and see the boiler for yourself; or, if you prefer, write for a list of the Carburetor Boiler installations in Philadelphia and vicinity.

For a copy of the illustrated and descriptive booklet which gives the facts about space-saving, low water line of 50", long life, and fuel saving, address Dept. BG 12.

Indiana limestone, steel, 2 stories add., 46x200 feet, slag roof, concrete cork floors, steam heat, electric light, metal lath, marble work, rolling steel sash, elevator, iron stairs, iron work. Contract awarded F. H. Mahon, Ardmore, Pa.

**Store and Apartment,** Brookline, Pa. Architect, Lloyd Gross, Nineteenth and Hamilton, Philadelphia. Owner, G. McGahan, Manoa road and Haverford avenue, Brookline, Manoa, Pa. Contract awarded J. Allen, Woodbury, N. J.

**Apartment Building, Dining Hall and Dormitory Building,** Holtwood, Pa., \$64,000. Architect, Lucius R. White, American Casualty Tower, Baltimore, Md. Owners, Pennsylvania Water & Power Company, Baltimore, Md. Contract awarded to L. W. Wohlsen, Brene-man Building, Lancaster, Pa.

## New Jersey Construction News

**Buildings,** Ocean City, N. J. Architect, Walter Smedley, Stephen Girard Building, Philadelphia. Owners, Abbott's Alderney Dairies, Thirty-first and Chestnut streets, Philadelphia. Brick, steel, office, 1 story, 69x27 feet, garage, 2 stories, 65x54 feet, stable, 1 story, 65x30 feet, shed, 1 story, 20x30 feet, slag roof, cement and pine floors, rolling steel

sash, architectural terra cotta. Architects taking bids due December 3rd.

**High School,** Delanco, N. J. Architect, H. Ziegler, 17 Washington street, Riverside, N. J. Owners, School District of Beverly Township, W. C. Pratt, Clerk, Delanco, N. J. Brick, 1 story, 104x240 feet (heating, electric work and plumbing reserved). Owners ready for bids due December 22nd.

**Church,** Pleasantville, N. J. Architect, V. B. Smith, Guarantee Trust Building, Atlantic City. Owners, First Baptist Church, Pleasantville, N. J. Stone, 1 story and basement, 48x100 feet. Plans in progress.

**Apartment and Store,** Florida and Atlantic avenues, Atlantic City. Architect, W. S. Hewitt, Guarantee Trust Building, Atlantic City, N. J. Owner, M. D. Augustine, on premises. Brick, steel, 3 stories, 26x62 feet, slag roof, pine floors, metal ceilings, iron stairs, plate glass, tile work, metal lath, hot water heat, electric light. Plans in progress.

**Apartment Building,** North Tennessee avenue, Atlantic City, N. J. Architect, Frank Larson, 10 South Tennessee avenue, Atlantic City. Owners, Gilbert T. Harris Corp., care of architect. Brick and steel, 4 stories, 75x75 feet, slag roof, pine floors, electric light. Architect taking sub-bids.

**Apartment,** North New York avenue, Atlantic City, N. J. Architect, Frank Larson, 10 South Tennessee avenue, Atlantic City. Owner, Mr. Cozart, care of architect. Brick, 2 and 3 stories, 25x60 feet, 25x70 feet, slag roof, pine floors, electric light, tile work. Architect taking sub-bids.

**Apartments (6),** 19 South Massachusetts avenue, Atlantic City, N. J. Architect, Benjamin Brown, Guarantee Trust Building, Atlantic City. Owner, I. Gulkin, 700 North Ohio avenue, Atlantic City, N. J. Brick, steel, 3 stories, 16x100 feet, slag roof, hardwood floors, hollow tile, roof ventilators, ornamental iron work, iron stairs, tile and marble work, metal lath, hot water heat, electric light. Architect taking sub-bids.

**Residence,** Margate Park, N. J. Architect, C. H. Adams, Chelsea Bank Building, Atlantic City, N. J. Owner, Captain Cranston, 110 Lincoln avenue, Atlantic City. Cinder block, 2½ stories, 22x36 feet, asphalt shingle roof, pine floors, hot water heat, electric light, tile work. Architect taking bids due December 10th.

**Residence,** Margate Park, N. J. Architect, C. H. Adams, Chelsea Bank Building, Atlantic City, N. J. Owner, Charles Rosevear, 3603 Winchester avenue, Atlantic City. Cinder block, 2½ stories, 22x36 feet, asphalt shingle roof, pine floors, hot water heat, electric light, tile work. Architect taking bids due December 10th.

**Apartment Building,** 3508 Ventnor avenue, Atlantic City. Architect, Frank Larson, 10 South Tennessee avenue, Atlantic City. Owner, Benj. Tolin, 3509 Ventnor avenue, Atlantic City. Limestone, brick, 5 stories, 40x80 feet, slag roof, hardwood floors, elevators, waterproofing, dampproofing, hot water heat, electric light, tile work, ornamental iron work. Architect will take sub-bids and owner will take general bids.

**Residence,** 843 Lois avenue, Camden, N. J., \$4,500. Architect, private plans. Owner, William Townsend, 2929 Westfield avenue, Camden, N. J. Frame, 2½ stories, 24x34 feet, slate surface shingle roof, hardwood and pine floors, warm air heat, electric light. Owner will build.

**Residence,** 852 North Thirtieth street, Camden, N. J., \$4,500. Architect, private plans. Owner, William Townsend, 2929 Westfield avenue, Camden, N. J. Frame, 1½ stories, 24x34 feet, slate surface shingle roof, hardwood and pine floors, hot air heat, electric light. Owner will build.

**Building,** head of Pine street, Camden, N. J., \$2,500. Architect, private plans. Owners,

Meehling Brothers, on premises. Concrete block, 1 story, 49 feet 6 inches x 70 feet, slag roof, electric work. Owners will build.

**J. Henchman Public School**, Woodland Manor, Delaware Township, N. J. Architects, Edwards & Green, 34 South Seventeenth street, Philadelphia. Owners, Board of Education, Camden County, N. J. Brick, cast stone, steel, cut stone, 2 stories and basement, 107x22 feet (plumbing, heating, electric, ventilating separate bids), John Mansville roof, maple floors, hollow tile, damp-proofing, metal lath, kalamein doors, bond, ornamental iron work, wrought iron pipe, painting and glazing. Architect taking bids due December 4th, 9 P. M.

**Convent Building**, Atlantic City, N. J. Architect, Frank A. Berry, Real Estate Trust Building, Philadelphia. Owners, St. Nicholas' Roman Catholic Church, Rev. J. T. Sheehan, on premises. Low bidder: John McShain, 1713 Sansom street, Philadelphia.

## New Jersey

### Contracts Awarded

**Community House**, Moorestown, N. J. Architects, Karcher & Smith, 34 South Seventeenth street, Philadelphia. Owners, Moorestown Community House, E. K. Johnson, Moorestown, N. J. Brick, cut stone, steel, 2 stories and basement, 120x60 feet, wing 75x45 feet, slate roof, maple and cement floors, hollow tile, plumbing, architectural terra cotta, metal casement sash, tile work, steam heat, electric light, dumb waiter, wrought iron pipe. Contract awarded Moore & Co., Schaff Building, Philadelphia, not yet signed.

**Private Hospital**, McClellan avenue, West of Broad street, Pitman, N. J. Architect, C. E. Schermerhorn, 213 South Fifth street, Philadelphia. Owner, Dr. H. Bailey Chalfant, Pitman, N. J. Cinder block, stuccoed, 1 story and basement, 42x67 feet, slag roof, hardwood and tile floors, plumbing, electric light, hot water heat, hospital equipment. Contract awarded to Mr. A. S. Denny, Pitman, N. J.

**Stores (5), Apartments (21)**, Boardwalk and Seaside avenue, Atlantic City, N. J. Architect, J. Ethan Fieldstein, Otis Building, Philadelphia. Owner, name withheld. Brick, 3 stories and basement, 65x80 feet, slag roof, hardwood floors, vapor heat, electric light, tile work. Contract awarded Morrell Bowen, Atlantic City, N. J.

**Residence**, 22 Stewart avenue, Camden, N. J., \$4,500. Architect, private plans. Owner, M. E. Gleason, 25 North Twenty-first street, Camden, N. J. Brick, 2 stories, 16x36 feet, slag roof, hardwood and pine floors, warm air heating, electric lighting. Contract awarded to William Dreese, 330 North Tenth street, Camden, N. J.

**Residences (2)**, 844-46 Lois avenue, Camden, N. J., \$4,000 each. Architect, private plans. Owners, James Wagner and Harry Lee, 553 Stevens street, Camden, N. J. Frame, 1½ stories, 26x32 feet, slate surface roof, hardwood and pine floors, warm air heat, electric light. Contract awarded to Joseph Munger, 1180 Bergen avenue, Camden, N. J.

**Building (add.)**, 350 Newton avenue, Camden, N. J., \$2,800. Architect, private plans. Owners, Public Service Railway Co., 350 Newton avenue, Camden, N. J. Brick, 1 story, 11 feet 8 inches x 57 feet, slag roof, steam heat, electric light. Contract awarded to Bennett-McLaughlin Co., 3260 Ludlow street, Philadelphia.

**Garages (8)**, Southwest Corner Locust and Liberty streets, Camden, N. J., \$2,400. Architect, private plans. Owner, W. H. Branin, 211 Kaighn avenue, Camden, N. J. Concrete block, 1 story, 8 feet 6 inches x 16 feet, slag roof, cement floors. Contract awarded to A. D. Stewart, 437 Winslow street, Camden, N. J.

**Foot Tunnel**, Oaklyn, N. J. Owners, Atlantic City Railroad, care of Philadelphia and Reading Railroad, Twelfth and Market streets, Philadelphia. Contracts awarded: Excavation and masonry, Craven Co., care of owner. Waterproofing, Martin & Breen, Inc., 1613 Sansom street, Philadelphia.

### Miscellaneous Contracts Awarded

**Residence**, Highpoint, Wilmington, Del. Architect, John A. McKibbin, Industrial Trust Building, Wilmington, Del. Owner, Samuel Handler, care of architect. Stone, 2½ stories, 40x49 feet, slate roof, hardwood floors, vapor heat, electric light, tile work. Contract awarded to Michael Capaldo, 3508 Market street, Wilmington, Del.

**Chapel**, Wilmington, Del. Architects, Gleason, Mulrooney & Burke, 404 South Broad street, Philadelphia. Owners, St. Anthony De Padua, Rev. J. Francis Tucker, Wilmington. Frame, 1 story, 45x60 feet, slag roof, pine floors, steam heat, electric light. Contract awarded Joyce & Kerrigan, Wilmington, Del.

**Church Building (superstructure)**, Thirtieth avenue, between Fifty-seventh and Fifty-eighth, Brooklyn, N. Y. Architect, E. G. Perrot, 1211 Arch street, Philadelphia. Owners, St. Francis De Chantel, Brooklyn, N. Y. Brick, 61x157 feet, heating and lighting extensions, copper roof, wood floors. Contract awarded P. J. Hoey Co., 166 Montague street, Brooklyn, N. Y.

(Continued from Page 772)

of the constructor have been fairly well covered in the remarks. His organization and plant should be suitable for the job and he should not be so loaded up with work that any job cannot be given proper attention by himself or his experienced assistants. His organization should be sufficient to satisfactorily cover a job and should possess the necessary team work to push it to completion.

He should have a good cost system so as to insure himself of reasonable prospects of a fair profit and so that the owner might, if necessary, obtain information that may seem important.

A constructor noted for fairness to his men will have good men and keep them, which is to his advantage and theirs, and the engineer's and the owner's.

The constructor should study the plans not only for his own uses, but also with a view of catching mistakes, for engineers are only human and sometimes make them.

There are some things which the constructor should not be called upon to be responsible for.

There are some clauses in common use in engineering specifications which disclaim responsibility on the part of the owner or engineer for information imparted to the constructor. In some cases these clauses apply to subsoil exploration made under the direction of the engineer or owner, and the constructor should not be expected to doubt their reliability.

Another clause applies to the checking of sub-contractor's details by the de-

signer. It has happened that the detailed design was wrong and not corrected in the checking. The constructor had nothing to do with the checking, but a literal reading of the contract and specifications would put the responsibility on him.

Such and similar clauses should not be written into the specifications and contract. The courts have held in several cases that they are contrary to common sense and are invalid.

#### *About the Workman*

Much of the success of a job depends on the skill, industry, and pride in their work of the men on the job. It is probably true that in the past a greater proportion of the men in the industry had this pride in their work than have it now. This is unfortunate, for it detracts from the quality and amount of work accomplished, as well as from the happiness of the men in their work.

The lack of pride in their work, of a part of the men at least, is probably due to the fact that they have never been given proper training in which they could acquire skill and learn the pleasure of being able to do something well.

Speaking in broad terms, the industry has been without an operative apprentice system for years, and as a result many men have come into the crafts without an opportunity to acquire the thorough training and skill which would make their work a pleasure instead of something to be avoided, as some seem to regard it.

A good system of apprentice training in actual operation and producing skilled workmen throughout the country is a necessity. The details of method or uniformity of methods in various parts of the country are not so important as it is that the training shall be thorough, shall produce a skilled workman who will have pride in the quality and quantity of work which he does and in his ability to do it.

A part of the responsibility for the lack of a properly operating apprentice system must be placed on organized labor, but a greater part of it must be placed on the constructors. The engineers and the owners must also bear their share of this responsibility. It is time for all the elements to get together and meet this crying need of the industry.

The important things which labor can contribute to the industry are the abolition of restrictive rules which prohibit a workman from doing something outside of the arbitrary limits now fixed, and the rules which limit the output of a man, active assistance in the establishment of an apprentice system, and what has so often been said as to be almost commonplace, but still of great importance—"an honest day's work for a good day's pay."

### *The Materials Group*

From 1914 to the depression of 1922, material prices were higher, and during the peak much higher in proportion, than labor rates, indicating a pyramiding of prices or profits. In 1923 they were again higher relatively than labor. They are now about on the same basis as labor.

The materials group can be of assistance in stabilizing prices, so far as possible, and keeping them as low as is consistent with the price of labor.

They can reduce the cost and reduce delay, which means increased cost, by standardization of products, thus making it easier for the constructor to fit in the various elements of construction. A great variety of product always means increased cost.

They can assist in the delivery of materials promptly and in the order in which they are needed.

Statistics seem to show that the materials group can do as much or more than labor towards stabilization of costs.

### *The General Situation*

Engineering construction is one of the principal industries and is too complex to be treated in the same manner as the buying and selling of goods, where the finished product may be examined before the purchase. The best results will be assured only when the work of designing and construction is placed with men of skill, competence and experience.

Even when work is so placed, the financial risks are considerable, particularly in late years when construction costs have varied so widely. Prior to the war, costs did not vary more than a few per cent. from year to year, and estimates could be expected to closely approximate actual costs. During and since the war, the construction industry has been subject to wide fluctuations in costs, which has greatly increased the risk to everyone concerned. A manufacturing building which would have cost \$88,000 in 1908 and \$100,000 in 1914, would have cost \$280,000 in 1920, \$160,000 in 1921, and about \$210,000 today.

This is an indication of the greatly increased risk introduced into the industry by such wide fluctuations in cost in these short periods.

These changes were induced by changes in the general business situation and are superimposed on the usual risks incident to all engineering construction.

Bids on complete plans and definite specifications frequently vary now as much as 40%, whereas, prior to the war, a variation of less than 10% was not uncommon.

One of the causes of the great fluctuation in prices is due to variation in the amount of work going on at a given time. During the war all other kinds of construction were curtailed on account of

war work, and now, for a period of a few years, the accumulated shortage of the war period is being overcome, together with the normal yearly amount. When this shortage has been practically made good, prices may come down and be more stabilized.

If too much construction is attempted and costs advance, the Owner is threatened with excessive costs and with having to mark off a portion of such cost later. When the inevitable reaction comes, all the other elements are threatened with a slacking off of business and unemployment occurs. An example of this occurred in the slump after the 1920 boom. During a period of reaction all the elements suffer from less business and unemployment and by loss of profits and savings which may have been accumulated during good times.

Everyone would be better off and would be able to conduct his business more safely if the industry could be more stabilized so as to get away from these wide swings in cost and volume of work.

### *A Serious Handicap*

One of the serious handicaps of the construction industry is the seasonal peaks which occur in volume of work. These same peaks greatly aggravate the problems in regard to apprentice training. In the years before the war, the higher cost of winter over summer work got the whole industry into the habit of avoiding winter work where possible. Some surveys have indicated that in northern climates at any rate this seasonal variation causes the workmen to be out of employment about a quarter of the time. For some kinds of construction it is more important to avoid the season of peak employment in the industry than it is to avoid winter weather. Many of the repairs and upkeep jobs can be done independent of the season. It will add materially in flattening the seasonal peaks in employment, and in material distribution, if as much of this work as possible is transferred to the off-peak seasons for the different crafts.

It is the duty of each of the various elements to work for a more uniform volume of construction.

The responsibilities each to the other of the various elements are the same as they are among all of the people with whom we maintain contact in everyday life, and will be met if we respect our own rights and those of the other fellow.

The professional men have attempted to define these rights in codes of ethics for their different groups. General business has not adopted written codes except in the form of laws, statutes and regulations which express the minimum standard of conduct which will be permitted. Business men of integrity have adopted for themselves much higher standards than those established by law.

The man who intends to live just within the law is not highly regarded.

### *A Deed of Service*

If the owner could be made to see the importance of deferring construction which is not absolutely needed to a period when the building program is fairly normal or low, he would be serving himself and the public well.

The engineer should be posted as to the amount of construction under way and proposed and be in a position to advise the owners as to the proper time to let his contract.

—The Constructor.

## Proposal

### ADVERTISEMENT FOR MECHANICAL EQUIPMENT FOR THE CAMDEN COUNTY CENTRAL POWER PLANT

Public notice is hereby given that sealed proposal for furnishing labor and material to construct, install and equip all apparatus in the Central Power Plant on grounds known as the County Farm near Asyla, Camden County, New Jersey, for the County of Camden, will be received and opened by the chairman of the committee on Central Plant in the meeting room of the Board of Chosen Freeholders, in the Court House, Camden, New Jersey, on the 9th day of December, 1924, at 2 P. M.

The work for which proposals are hereby invited, and for which bids will be received, includes all labor and material necessary to properly construct and install the following: boiler feed and condensate pumps, general power plant piping, valves, fittings, etc.

The right is reserved to accept or reject any or all proposals or to waive any informality in any proposal presented. All bids must be in sealed envelopes endorsed "Proposal for Central Plant" and stating the branch of work covered. (No bid will be considered unless accompanied by a certified check to the order of the County of Camden, or cash in the amount of 10% of the bid, the certified check or cash to accompany the bids. In case the bid is less than \$5,000.00, said check or cash must not be less than \$500.00), and also a statement from a Surety Company that it will provide the contractor with a bond, binding the bidder to execute a contract if awarded to him. The terms of the proposal with surety required are fixed by the specifications.

Copies of the drawings and specifications will be on file in the office of the Engineer for the purpose of estimating. A limited number of copies of the plans and specifications will be loaned to prospective bidders on deposit of a certified check to the Engineer's order for fifty dollars (\$50.00). The plans and specifications may be obtained by application to Frank H. Schaefer, Engineer, 306 Temple Building, Camden, New Jersey.

Check will be returned at time of returning plans and specifications, but should they not be returned, the deposit may become forfeited.

County of Camden a municipal corporation of New Jersey by the Committee of the Board of Chosen Freeholders on Central Plant.

ELMER E. STAFFORD,  
Chairman.

FRANK H. SCHAEFER,  
Engineer.

## Changing an Attitude of Mind

It has been the tendency of the public to look upon insurance as something on which it must first be "sold" by convincing arguments of the insurance man.

That this attitude is undergoing a change is evidenced in the number of people who no longer wait for the agent to solicit their business but who seek out the agent and ask for insurance advice.

By its national advertising the Insurance Company of North America is helping materially to bring about that hoped for time when people will "consult their insurance agent as they consult their doctor or lawyer."

Represent North America.

## For Lowering the Freezing Point of Concrete—

And making it Permanently Hard and Waterproof

THE addition of "ANTI-HYDRO," a liquid integral compound, to the gauging water, lowers the freezing point of concrete from 15 to 18 degrees, allowing you to work right on through the cold weather.

"ANTI-HYDRO" also makes concrete *permanently* hard and waterproof, all in one operation. Easy to use—simply mix it with the gauging water.

For 20 years "ANTI-HYDRO" has proved to be the best by test.

## As The Editor Sees It

### The Selection of General Contractors and Sub-Contractors

*Issued by the Philadelphia Building Congress for the Information of Owners, Architects and Engineers, in the interest of the Building Industry, and the efficient, economical and workmanlike execution of Contracts*

*This Statement is identical in wording with that of the Boston Building Congress, issue of April, 1924, and has been formally adopted by the Executive Committee of the Philadelphia Building Congress*

#### Desirable Procedure

In the interest of the building industry and the efficient, economical, and workmanlike execution of contracts, the Philadelphia Building Congress urges upon Owners, Architects and Engineers, the adoption of the following practices in securing estimates and awarding contracts.

(1) Do not ask for competitive approximate estimates unless adequately paid for.

(2) Furnish complete, clear and accurate plans and specifications when asking for bids.

(3) Invite only a limited number of Contractors to compete, six generally providing adequate competition.

(4) Invite for a given piece of work Contractors of substantially equal ability and standing.

(5) Invite only Contractors to whom you are willing to award the contract.

(6) Having invited bids as provided above, award the work to the low bidder, unless other considerations than price are

to enter into the award, in which case make this fact perfectly clear in the notice to bidders.

(7) Where the time for the completion of the work is important, name a definite time, on which all bids shall be based. Do not invite bidders to name their own time limits as well as their prices.

(8) Eliminate as far as possible Unit Prices, Alternate Estimates and Secondary Estimates when asking for bids.

(9) Do not award a General Contract without determining in advance the Sub-Contractors to be used on the principal portions of the work.

(10) In order to determine Sub-Contractors in advance follow one of the following methods or a combination: (a) provide that the General Bidders shall name the principal Sub-Contractors they intend to use in their proposals; (b) submit to the General Bidders a list of approved Contractors for such important sub-contracts; (c) secure principal sub-bids and send a list of designated

names and amounts to all General Bidders to be incorporated in their bids.

(11) Where work is covered by allowances to be adjusted after the General Contract has been awarded, reduce such items to the practicable minimum, and do not include under "Allowances" Sub-Contracts of major importance.

(12) In selecting bidders for designated bids, or allowances, or for separate contracts, give due consideration to their labor policy, according to the policy adopted for the General Contract.

In explanation of the foregoing statement the Philadelphia Building Congress submits for the careful consideration of Owners, Architects and Engineers, the following comments on current practices in securing estimates and awarding lump sum contracts for private building operations. Contracts for public work involve other considerations and are not referred to in these comments.

#### (1) Approximate Estimates

Before actual bids are asked for, approximate estimates are frequently desired

**DRAWING  
MATERIALS**

**CHARLES H. ROBBINS CO.**

Philadelphia  
KEYSTONE PHONE, RACE 3519

**BLUE  
PRINTS**

ed. A Contractor's detailed knowledge of actual costs is of value to supplement and check an Architect's or Engineer's judgment.

In asking for approximate estimates from Contractors, for the preliminary guidance of an Owner, the cost of making up such an estimate should be borne in mind, and if excessive should be paid for. A single responsible Contractor, familiar with the character of work involved and with the standard of work desired by the Architect or Engineer, can prepare an estimate which will have real value to the Owner.

The Architect or Engineer should give the Contractor as complete information, plans and instructions as possible. Approximate Estimates which are carelessly made are misleading to the Owner at the time when he most needs accurate information, and will react as unfavorably on the Architect, Engineer and Contractor as they may be annoying and expensive to the Owner.

#### (2) Plans, Specifications and Forms of Contract

In asking for definite bids, complete plans and specifications are of course a first essential. Incompleteness, inaccuracy or conflicts in the drawings and specifications increase the cost of preparing the estimates and generally also add to the amount of the bids unless, through confusion or error, they result in mistakes that improperly reduce the estimate below a reasonable figure. In either case, the result is unfortunate.

The method of handling a contract differs with the practice of the Architect or Engineer, or with the special conditions of a particular building operation, being generally one of the following:

(1) A General Contract, including all trades.

(2) A General Contract, including all trades except Plumbing, Electric, Elevators and Heating.

(3) No General Contract, each trade being let separately and handled through the office of the Architect or Engineer.

The last method is seldom used in this part of the country, though it is the rule in some cities.

In either of the first two methods there will be a large number of sub-trades handled by the General Contractor, and the method by which estimates are secured and General Contractors and Sub-Contractors selected for the work is important to all concerned, no less to the owner and his Architect or Engineer, than to the Contractors themselves.

#### (3) Limited Number of Bidders

The cost of estimating is an overhead charge on the industry which has to be paid and it enters into the estimates for all buildings. It is desirable to reduce it

to a minimum, and the first step is to limit the number of bidders invited. Five or six bidders will give the ample competition which the Owner desires to assure himself of the reasonableness of the Contract price. To invite ten or fifteen merely adds to the cost of estimating without adequate return.

#### (4) Selection of General Bidders

The careful selection of the General Contractors to be invited to figure is of the first importance and it must be recognized that all grades of ability are to be found in the list from which one must choose. It is at this point that the Owner, through his Architect or Engineer, must determine whether price alone shall control the selection or whether and to what degree quality of performance is desired.

Assuming, for example, five grades of ability, it is undesirable as well as futile to ask Contractors of Grade A to figure in competition with Contractors of Grade E. This is too frequently done. If the A man becomes aware of it he generally either refuses to figure or submits a "safe" bid so high as to put him out of consideration. In either case, the Owner loses the competition which he seeks, and the A man, if he consents to bid, wastes his time.

The character of work expected should be determined and a limited group of bidders invited who are as nearly as possible of equivalent ability, and of the general calibre desired.

In selecting any but thoroughly skilled and efficient Contractors, it must be acknowledged in advance that something less than first quality work is expected and must be accepted. This applies as well to the administrative functions of the General Contractor as it does to the craftsmanship of the mechanics whom he and his Sub-Contractors employ. You cannot secure a grade of work higher than the ability of the man who performs it.

#### (5) Pacemakers

Sometimes a group of high grade Contractors are invited together with one of a lower grade, who is looked upon as a sort of "pacemaker." This is an undesirable and unreasonable practice. No one should be invited to bid to whom the Owner is unwilling to award the work. When a "pacemaker" is invited, either his time or that of the other bidders is being wasted.

#### (6) Award to Low Bidder Unless Otherwise Specially Provided

Having invited a selected group of substantially equal ability, to anyone of whom an award would be satisfactory, then under normal conditions, the Contract should be awarded to the low bid-

## Proposal

### ADVERTISEMENT FOR THE CONSTRUCTION OF BUILDINGS FOR THE N. J. SCHOOL FOR THE DEAF, TRENTON JUNCTION, N. J.

Public notice is hereby given that sealed proposals for furnishing labor and materials to construct and equip ready for furnishing the following buildings for the School for the Deaf, will be received by the Architects at the State House, Trenton, New Jersey, on Monday, the 29th day of December, 1924, at 2.30 o'clock P. M., at which time all proposals submitted will be opened and publicly read. The buildings are as follows:

**ITEM "A"**—The Main School Building. This includes the School and Administration Building, Dining Hall and Kitchen, Auditorium, Gymnasium, and Locker rooms. This building to be constructed with concrete and brick walls and fireproof construction, and contains approximately 724,000 cu. ft.

**ITEM "B"**—The Shop Building. This building to be constructed of concrete and brick walls—fireproof construction and contains approximately 171,000 cu. ft.

**ITEM "C"**—The Laundry Building (addition to Boiler House). This building is to be constructed with concrete and brick walls and semi-fireproof construction, and contains approximately 64,000 cu. ft.

**ITEM "D"**—The Superintendent's House. This is an alteration to the old stone building, and a frame addition thereto, containing approximately 20,000 cu. ft.

These buildings are to be erected on the grounds of the School for the Deaf, Sullivan Way, near Trenton Junction.

Bids will be received as follows:

Base bids, including items A, B, C, D, will be received for,

General Construction  
Heating and Ventilating  
Plumbing Work  
Electric Work.

Separate bids for items A, B, C, D will be received for,

General Construction  
Heating and Ventilating  
Plumbing Work  
Electric Work.

Said Proposals must be on blank forms provided for that purpose, and must be enclosed in sealed envelopes endorsed "Proposals for the School for the Deaf," and must state the branch of work for which proposal is submitted.

No bid will be considered unless accompanied by a certified check to the amount of five per cent. of the bid, or if the amount of bid shall exceed \$200,000.00 in the amount of \$10,000.00 binding the bidder to execute a contract if awarded to him. The terms of the proposal with surety required are fixed by the specifications, to which reference may be had. The right is reserved to reject any or all bids submitted, also, to waive any informality in the same.

Copies of the drawings and specifications may be seen at the Architect's offices, and copies will be loaned to bidders by the Architects on deposit with them of a certified

**ADVERTISEMENT FOR MECHANICAL  
EQUIPMENT FOR THE CAMDEN  
COUNTY CENTRAL POWER  
PLANT**

Public notice is hereby given that sealed proposal for furnishing labor and material to construct, install and equip all apparatus in the Central Power Plant on grounds known as the County Farm near Asyla, Camden County, New Jersey, for the County of Camden, will be received and opened by the chairman of the committee on Central Plant in the meeting room of the Board of Chosen Freeholders, in the Court House, Camden, New Jersey, on the 19th day of December, 1924, at 2 P. M.

The work for which proposals are hereby invited, and for which bids will be received, includes all labor and material necessary to properly construct and install the following: boiler feed and condensate pumps, general power plant piping, valves, fittings, etc.

The right is reserved to accept or to reject any or all proposals or to waive any informality in any proposal presented. All bids must be in sealed envelopes endorsed "Proposal for Central Plant," and stating the branch of work covered. (No bid will be considered unless accompanied by a certified check to the order of the County of Camden, or cash in the amount of 10% of the bid, the certified check or cash to accompany the bids. In case the bid is less than \$5,000.00, said check or cash must not be less than \$500.00, and also a statement from a Surety Company that it will provide the contractor with a bond, binding the bidder to execute a contract if awarded to him. The terms of the proposal with surety required are fixed by the specifications.

Copies of the drawings and specifications will be on file in the office of the Engineer for the purpose of estimating. A limited number of copies of the plans and specifications will be loaned to prospective bidders on deposit of a certified check to the Engineer's order for fifty dollars (\$50.00). The plans and specifications may be obtained by application to Frank H. Schaefer, Engineer, 306 Temple Building, Camden, New Jersey.

Check will be returned at time of returning plans and specifications, but should they not be returned, the deposit may become forfeited.

County of Camden, a municipal corporation of New Jersey, by the Committee of the Board of Chosen Freeholders on Central Plant.

ELMER E. STAFFORD,  
Chairman.

FRANK H. SCHAEFER,  
Engineer.

Secretary of Commerce, Herbert Hoover, a few years ago had occasion to investigate conditions related to the slate industry, which revealed the rather astonishing fact that here was one branch of industry marketing a very practical and useful commodity that stood aloof from conventions and get-together affairs of all sorts which serve in these days to bring man face to face for the discussion of trade problems and the ironing out of misunderstandings, the cultivation of better feeling and the realization that, after all, men are just men and business is a human sort of enterprise if mutual understanding is developed.

Warner S. Hays, then secretary of the National Federation of Construction Industries, took counsel with Secretary Hoover and sent out a call to slate producers of the United States, suggesting a conference in New York to discuss the advisability of taking some action which might result in bringing the components of the industry together in an effective way. Eighty per cent. of the producers and leading distributors responded and a heart-to-heart conference resulted in a unanimous expression that an association was needed and Mr. Hays was commissioned to proceed with its organization.

That Mr. Hays' efforts have borne fruit is evidenced by the large and growing interest shown in the summer outings and the sectional meetings of slate men in various parts of the country and the increasing attendance at the Annual Conferences of the Slate Industry in New York, which are open to and attended by all who are in any way associated with the quarrying, sale or installation of slate and the converting of slate to the many useful and necessary purposes for which slate is used.

Don't crowd your space, Mr. Advertiser. Better play up one selling point at a time than to try to get everything into one ad and kill every possible chance for display. An ad. should stand out. It should be easily read. It should draw the attention of the reader. A carload of detail can't be crowded into a few inches of space and still retain the quality of sticking out as all good advertising should.

I make it a rule never to write a grouchy letter—I telephone.

(Continued from page 788)

der. It should be borne in mind, however, that competition based solely on price tends to reduce the character of service and quality of work estimated on and performed and therefore to reduce the standards of performance in the industry.

Frequently the character of the work may be such that it is impossible to select a group of bidders that are exactly of equal ability to handle it as desired, and that, up to a certain amount, a higher bid may be offset by some special qualifications of the bidder. If factors other than the amount of the bid are to be taken into consideration in making the award, this condition should be clearly stated in the notices to bidders. The usual clause reserving right to reject any or all bids and to accept any bid is a legal protection that is desirable and reasonable in all bidding, but if special conditions will enter into the award in addition to price, it is only fair to the bidders that this fact should be clearly stated in advance, in addition to the legal reservations above referred to.

**(7) Time Limits**

Time is often of the essence of the Contract, and a time limit for the completion of the work involved in the making of estimates. Frequently the bidders are asked to state in their bids the time within which they will complete the work. This is an undesirable practice as it adds a second element of competition and confuses the award. If a time limit, with or without forfeit and bonus, is desired, a reasonable or the necessary time should be stated in the General Conditions of the Contract Form and all bidders required to submit their bids on this basis.

After bids are received, consideration of the effect of the time limit on the price may well be discussed with the successful bidder in order to determine how an earlier or later time would affect the cost, taking into consideration the use value of the completed building to the Owner. It should not, however, be taken up with other than the successful bidder as this would open up undesirable opportunities for cutting prices on the score of time in an attempt to defeat the legitimate advantage won by the successful bidder in the original estimating.

**(8) Unit Prices, Alternate Estimates and Secondary Estimates**

Unit prices required as part of a bid are confusing and very often fail of their purpose. Prices for units of work not carefully and accurately defined are frequently not properly applicable to the work as it later appears; and an elaborately itemized schedule of unit prices that will fit accurately all future contingencies is cumbersome and confusing. Unit prices on general building construc-

tion should be used sparingly and with caution.

Inclusion of alternate estimates in a proposal sheet is an undesirable practice. Where many are required it adds greatly to the expense and the difficulty of preparing a bid, and injects an element of confusion into the determination of the successful bidder. The major items of cost should be analyzed by the Architect in advance, the plans prepared on a basis as nearly as possible meeting the financial requirements and any further adjustments determined in conference with the successful bidder.

Secondary estimates, after the bids are received, upon various items, usually small and often reductions, introduce the chance for bidders to revise their original bids by quoting new prices widely at variance with the value of the proposed changes. This opportunity is often taken, making in effect a second chance to bid upon the entire work. This practice is therefore faulty because it requires contractors to bid twice, the second bids carrying a greater element of gambling and price cutting, which lead to business instability. The practice should therefore be discontinued whenever possible, and changes should be handled only with the successful bidder.

#### (9) *Determine Sub-Contractors in Advance*

The reason for a General Contractor is his ability to administer the building operation affectively, executing with his own direct employees certain portions of the work and directing the various Sub-Contractors and correlating their work so that proper progress is secured. It cannot be denied that many who go by the designation of General Contractor are incompetent to perform these important functions properly. Their experience, organization and reputation based on performance, should be more carefully investigated than is frequently the case before they are invited to bid. The "separate contract" system under the Architect or Engineer is preferable to the General Contract system with an incompetent or dishonest General Contractor.

In any event, generally a large majority of the work will be done by "Sub-Contractors." Their ability to perform the work is of great importance to the Owner. It is not sufficient to rely solely on the reputation of the General Contractor for he cannot reproduce for the Owner work of a better quality than the abilities of his Sub-Contractors and their mechanics.

Therefore, wherever quality of work is to be considered and not merely price, it is important to select Sub-Contractors with as much care as General Contractors. Many General Contracts, however, are awarded on a lump sum without any reference to the Sub-Contractors to be

used in the work. Such a method is to be condemned. Unless the Sub-Contractors are known the quality of work figured on is not clear and the award is made in ignorance of this important fact. Such a method also encourages re-figuring of Sub-Contracts after the award for the purpose of securing lower prices merely to increase the profit of the General Contractor to the detriment of the Owner's interest.

All Sub-Contractors of importance should be determined before the General Contract is awarded and should constitute a factor in the award. This can be done in various ways.

#### (10) *Methods for Selecting Sub-Contractors*

##### (a) *Sub-Bidders Named in Proposal*

The simplest way is to require the General Bidders to name for the principal trades the Sub-Bidders whom they intend to employ. These names can be reviewed and any that are not satisfactory can be changed before an award is made. It should, in such case, be made clear in the notice to bidders that the character of the Sub-Bidders will be given consideration in making the award. The Owner will then be entitled to demand better Sub-Contractors of the low bidder, or to accept a higher bid if it is based on a better grade of Sub-Bidders. A General Bidder can easily produce a low bid by the use of a group of undesirable Sub-Bidders. If the General Bidders are to be justly compared on price, the groups of Sub-Bidders must be reasonably equal in ability.

##### (b) *List of Approved Sub-Contractors*

Instead of requiring the naming of Sub-Bidders in the proposal, the Architect or Engineer may submit to the General Bidders a limited list of Sub-Contractors in each trade, any of whom will be acceptable. In making up this list consultation with the General Bidders is often desirable. This will save the time of Sub-Bidders who might not be satisfactory and will simplify for the General Bidders the securing of estimates in these trades.

##### (c) *Designated Bids*

Another method that has been used to a considerable extent is to require Sub-Bids on certain designated portions of the work, from Sub-Contractors selected as set out in the preceding paragraph, to be delivered to the Architect some days in advance of the General Bids. A list of the selected Sub-Bidders and the amounts of their bids are sent to all General Bidders a day or two in advance of the date the General Bids are due. All General Bidders are instructed to base their General Bids on the use of this list of designated Sub-Bids.

The advantage of this system is that it permits the selection of a more satis-

factory list of Sub-Contractors and eliminates this often complicated problem when the General Bids are under consideration, thus expediting the selection of a General Contractor and the award of the Contract. Sub-Bidders can submit their net estimates in the assurance that they will get the Contract at the price they name if at all. It permits the General Bidders to know the Sub-Bidders on the principal parts of the work at least a day or two before their own bids are due instead of receiving them within a few hours of that time.

The objections raised to this system are that it may weaken the control of the General Contractor over the Sub-Contractors so selected; that the Architect and Owner assume certain responsibilities by such procedure not otherwise assumed; and that under this procedure a General Bidder may have to assume a Sub-Contractor that is not satisfactory to him either in ability or on personal grounds. In answer to these objections, those who have used this system testify that control over Sub-Contractors has not actually been reduced in such cases; that it is possible that some added responsibility for the Architect is involved, necessitating carefully drawn documents, but that since the Contractor has more time to survey these Sub-Bids he is in a better position to assure himself that all points are properly covered and so may reasonably be held for all contingencies. As to assumption of unsatisfactory Sub-Bids, a General Bidder is always at liberty to state that a designated Sub-Bidder is not satisfactory to him and that his bid is based on the use of another named Contractor for such work. This would always be considered if his bid was low and his objection to the Sub-Bidder reasonable. In spite of the objections cited it appears to be the best procedure to follow where a high grade of work is desired.

##### (d) *Above Systems Combined*

The above three systems may be used in combination arranging for "designated bids" on a limited number of items of major importance and providing for the naming by the General Bidders of Sub-Bidders in other less important branches of the work, or, in some cases, the naming by the Architect of an approved list of Sub-Contractors.

#### (11) *Specialties and Allowances*

Some branches of the work are of the nature of specialties on which real competition is not possible, or which involve service by cities, towns, or public service corporations not subject to estimate. In such cases, the Architect must secure such estimates as he can for the particular work desired,—in some cases only a single bid perhaps being obtainable. For all such work the "designated bid" is the natural method to pursue, and the Contractor ex-

pects to have such Sub-Bidders definitely selected by the Architect.

So far as practicable definite bids on these specialties should be obtained in advance of the General Bidding. Where not practicable to do so the work may be covered by an "allowance" and figured later. It is not desirable, however, to cover many important items in this way as it leaves the General Bidder in doubt, when submitting his bid, on matters that may have an important bearing on the progress of the work.

#### (12) Labor Policy

In a community where there is a general trade agreement in force it is wise for an Owner to determine definitely in advance whether his work shall proceed in accordance with such agreement, using organized labor, or ignoring such agreement using unorganized labor. All Contractors on a job should be of the same kind in order to prevent delays and labor disputes. An Architect or Engineer in selecting Sub-Bidders, on any of the above mentioned plans, should bear in mind the general labor policy adopted for the work.

### CASEMENT WINDOWS

BY EDNA KNOWLES KING

The prospective builder discovers that building a new home involves a thousand and one choices. First the lot is chosen, and then the style of architecture that will best suit his needs, express his taste, and suit the site. Then a thousand and one small choices are made in conference with the architect. He goes over the plan and specifications from the shingles on the roof to the basement floor. While the task is highly interesting, still it is with a sigh of relief that he discovers there are two types of windows from which he must make his choice: the double hung and the casement.

The double hung window is the "common ordinary garden variety" that slides up and down and is well known generally. It originated in Holland. The Pilgrims caught the idea of this sort of window during their sojourn in Holland and used it in their new homes in this country. During the intervening years the double hung window has been used over and over again without special consideration as to its beauty, convenience, or utility.

To begin with, casement windows admit twice as much air as the same size double hung windows, as the latter are never more than half open when they are opened their widest. Casement windows really bring the beauties of the outdoors indoors, for when they are flung wide open the loveliness of the flower garden, the strip of lawn; the distant hills are so plainly visible that there is no feeling of being shut up in a house away from it all.

Then there is a romance to the words "casement windows." They bring to mind quaint, thatched cottages in far-off England and France. A home that is so plain it is classed as ordinary may be given distinction by the use of casement windows. It is done time and time again. Sometimes the architect sees fit to use both casement and double hung windows in the same house to give an interesting variety to the exterior and a greater elasticity and convenience to the arrangement of rooms.

These questions are occasionally raised by prospective builders: Is it correct to use casement windows in a stone house, in a brick house, in a colonial, in a cement, in one of Spanish inspiration? "Yes," is the answer to all of these questions. Occasionally an architect is questioned as to whether it is advisable to use casement windows in a country where there are frequent storms. "Are they really weather-proof?" is the way the question is put generally. The answer to this question is: while there are casement windows on the market whose manufacturers have not yet succeeded in making them absolutely weather-proof, there are casement windows guaranteed in this respect and put out by reliable manufacturers that are absolutely weather-proof.

Other qualifications necessary to complete satisfaction have been fulfilled, also. Some of these are: a maximum or a minimum of ventilation without a draft is possible; the windows are so constructed that they work easily and quietly; windows and screens are planned so that there is no interference between them; windows are self-adjusting, so that the wind cannot rattle or slam them shut, thus enabling perfect control of the ventilation; and the windows are easily washed from the inside.

While the subject of how to successfully screen the casement window was a baffling one at first, this has now been solved in several practical ways. There are excellent adjusters on the market that make it possible to open or close the windows through the screen. Sliding screens that make the windows easily accessible placed next to the sash on the inside are used, too. The shades and draperies are then placed on the inside of the screen. This allows the operation of the shades without opening the screens each time, and in addition, the screen acts as a protection against the shades and drapes being blown out of the window when open.

To be really efficient, windows must shut out storms, operate freely, and stand up under varying weather conditions. Solid steel construction with strongly welded corners make an exceptionally durable window, one that has strength to remain true and rigid through many years of service.

Wooden casement windows are not made in stock sizes but are made to order for individuals. In most instances the hardware is furnished by a different firm from the one making the sash (special prices are made by the mills on orders for ten or more windows of a size), so there is a financial saving in using a great many windows of the same size.

The proper proportions for the best artistic effect should be observed in determining the size: a "square" casement window never has the beauty that a window planned on the same proportion as average doorway. When the casement windows swing out, the storm sash is on the inside, as are the screens. They may be either hinged or made to slide unless some form of casement operator is used that extends through or under the bottom rail of the storm sash. When the casement windows swing in, the storm sash is put on the outside in just the same manner as with the double hung windows.

Windows which fold together leaving a wide clear opening are very desirable, especially where a good view of the surrounding scenery is wanted. One of the leading manufacturers of hardware makes complete equipment for such windows.

Several sash are so connected in series and placed between an upper and lower track that they may be opened and slid to one side of the frame. The operation is smooth and the sash are water-tight when closed. They will also remain stationary in any position. It is possible to get a clear opening width of 16 ft. using this construction, but of course, this is extreme and in small homes an 8 ft. opening would be entirely satisfactory.

The return of the popularity of the casement window is most welcome to all architects and homebuilders who like to see the principles of beauty worked out so long ago, kept alive. It is encouraging after lapse during Victorian period.

—Keith's Magazine.

The forthcoming gathering, on January 19th and 20th, 1925, at the Hotel Commodore, New York, will find present members of every branch of the industry, from the man who quarries to the man who sets, from the slate roofer to the school slate man, all correlated and functioning under one head and sanction. A harmonious whole acting together on the problems of the industry. The men who pioneered the movement, the group who have worked so successfully for the expansion of the industry, the team workers, who have carried their standard to victory, they will all be there, intent on bringing slate and the consideration of its uses into its proper place in the sun of business competition.

## Changing an Attitude of Mind

It has been the tendency of the public to look upon insurance as something on which it must first be "sold" by convincing arguments of the insurance man.

That this attitude is undergoing a change is evidenced in the number of people who no longer wait for the agent to solicit their business but who seek out the agent and ask for insurance advice.

By its national advertising the Insurance Company of North America is helping materially to bring about that hoped for time when people will "consult their insurance agent as they consult their doctor or lawyer."

Represent North America.

## As The Editor Sees It

### CUTTING BUILDING COSTS BY SAVING LABOR AT THE SITE

BY MORGAN G. FARRELL

One of the big leaks in the payroll is the labor wasted through aimless placing of the material as it arrives at the site. A truck drives up—"Where do you want this?" The foreman, busy with something else, barely turns his head, "Dump it over there." And over there it goes—right where the house-sewer trench must be cut. Later a few laborers will spend two or three hours moving it somewhere else.

Or several loads of lumber arrive. They are also unloaded "over there," with the result that the sills go into the bottom of the pile, with the rafters on top. It does not take very long for the material to get out of control. Piles have to be moved, timber carried twice as far as might be, parts cannot be found and are reordered, material rusts and decays.

How much is lost through this cause depends on the competence of the man in charge of the work. There is some such loss on every job. Fore-handed planning alone can keep it down. Orders must be placed early with a definite schedule of quantities and dates of delivery. A copy of the schedule must be given the superintendent, who will then be able to plan, to receive and place each delivery so that it will be accessible and convenient to the work.

A method of scheduling the job is sug-

gested. It is simply a tabulation of the different operations (excavations, foundations, etc.) with the estimated dates when each will start and finish. A similar tabulation based on the operating schedule should show each order and the agreed dates of delivery. The orders covering not only material but sub-contracts as well. Of course, such a schedule must necessarily be approximate. Unfavorable weather and delays of one kind or another are inevitable. Every effort should nevertheless be made to adhere to it; and the contractor himself should lose no occasion for impressing on his force, that they are working against time and are expected to keep to the schedule.

The next important step is to lay out on the plot a place for all material to be received with special regard to the order in which it will be used, the part of the work into which it will be built, protection against the weather, checking it out of stock and accessibility.

This may appear, to those who never tried it, to involve too much system. They may be assured that experience has demonstrated that such system will more than pay for itself, in the actual waste and duplication it prevents.

The writer well recalls a lesson in this form of efficiency, he learned while in charge of army shops at the advanced depots for engineering material in France during the war. As it has a decided bearing upon the problem under

discussion, it may not be amiss to recount it.

Our own depots in the back areas were in an incredible state of disorganization at first. The working force was green. Plans were incomplete or unpublished. Material was coming in by the train-load and nobody knew what or how much to expect. Working shorthanded, the engineers could only keep at it day and night and get the stuff off the cars somehow or other. It seemed that every engineering material and equipment under the sun was piled up in mountains on both sides of the tracks. How it was checked in at all was a mystery. And then would come in the requisitions carefully detailed for 2 kegs 20d nails, 6—2x4—20, 16—2x8—18, 1—type-writer, 1 box blue carbon paper, etc.

"Try and find them," said the officers.

Of course the chaos was reduced to order, after a while, and those same depots became models of systematic arrangement and operation.

In the meantime, we took over the French sector around the St. Mihiel salient, including their engineer depots. These were organized in a way to gladden a builder's heart. They were all laid out on about the same plan. A driveway entered at the highway front, described a loop through the grounds and came out a hundred yards or so from the point of entrance.

A standard gauge spur bisected the

**DRAWING  
MATERIALS**

KEYSTONE PHONE, RACE 3519

**BLUE  
PRINTS**

space enclosed by the loop. At one side of it and thirty feet distant was a 24 inch gauge track with spurs leading to different parts of the yard.

Goods came in by standard gauge road and went out on truck trains or on the narrow gauge military railways.

Incoming material was neatly stacked in *small* piles with working space all around each pile. No attempt was made to bring all lumber to one spot. On the contrary there would be a pile of 2x6 inches here and another 200 ft. away and others scattered about the yard. This facilitated handling. It made unloading easy for the lumber in a car spotted in Section 5 could be unloaded right there instead of being carried some distance to a single section assigned to lumber.

It facilitated loading, for truck trains were divided into sections of about five trucks each, of which one truck, perhaps, in each section was to be loaded with 2x6 inch plank. As a train consisting of four to eight sections entered the yard it was strung out over 500 to 1000 ft. of driveway.

No matter where a lumber truck stopped it was not far from a pile of the material scheduled for it. Besides, these depots had knock-down buildings for covered storage and small machine, forge and carpenter shops.

Now the same system is applicable to any construction job. In placing the material for, say a school contract on the ground, there is no good reason for piling all the brick in one place, all the lumber in another, etc., as is generally done. The reverse is true. The brick should be placed in several piles about equidistant from one another, all around the building.

Thus the laborers draw from the pile nearest the section of the work they are serving. The same applies to any bulk material that is stored in the open. It may even be true of sand and gravel for concrete, under conditions where it can be shown that it is cheaper to move the mixer and shorten the barrow travel, than

to keep the mixer fixed with a corresponding increase of travel.

Naturally, what is to be said about the disposition of material on the site applies only to operations in which there is some working space around the building.

On a city job where plant and materials must be placed in the street, on the sidewalk platform or in the first floor of the structure, the method of procedure is quite different, though the same principles govern.

But where the lot is large enough to permit a fair amount of storage space, the following requirements must be met, for efficient handling:

- (a) A practical roadway to give access to the main portion of the material yard.
- (b) Open storage for bulk material in the order of use and in sufficient quantity to keep ahead of the demand.
- (c) Covered storage for such stock as must be protected from the weather.
- (d) Tool and equipment shed.
- (e) Office.
- (f) Sheds for sub-contractors, and
- (g) Shop space for fabricating on the ground.

Considering these in order:

The builder, anxious to get started on the work of construction, has little time or effort to give to the matter of a driveway. But even if the ground is dry and solid it will pay him to stake out a road in accordance with his yard plan and compel all vehicles to keep in the groove. As traffic wears ruts in the ground, he should fill them up with gravel. Thus the roadway will improve with use instead of becoming impassable.

In spring, wet weather or in soft ground, it is a good practice to dig two wheelways 9 inches deep and 18 inches wide and fill them with cinders or gravel. One yard of either will build 9 feet of road strips at a cost of 10 to 25 cents a foot. It will be money well spent. Very soft spots may be bridged by laying undressed timber stringers, four or five to the road width and spiking to them 2 or

*Logan Baptist Church, 13th and Ruscomb Streets, Philadelphia, Pa. Heated by one 7-40 and one 4-40 Novelty Carburetor Boilers.*

*Architect: Clyde S. Adams, 2038 Spruce Street, Philadelphia, Pa.*

## *They Need Not Worry*

They burn soft coal; but the Philadelphia newspaper discussions on the prohibiting of smoke does not worry the Trustees of the Logan Baptist Church. They have no smoke. The enforcing of the city ordinance will have no effect upon them.

The heating appliance used there burns the smoke and gases before they leave the boiler. The remaining substance passes out of the chimney in the form of a mist which is practically invisible.

Still more important than this, is the money saved in the buying of fuel. Most churches are confronted by the question of finances. The trustees of the Logan Baptist Church reduced their coal bill two-thirds by burning soft coal.

The Novelty Carburetor Boiler is designed to burn any kind of fuel, and this enables the

church authorities to buy the cheapest and most available kind.

The patented carbureting chambers (one to each section), on the rear of the boiler, automatically mix all of the smoke, gases, and carbon with the oxygen from the air and burn them. The air enters the top and bottom slots of the Carburetor, as illustrated in the picture. No adjustment of air intake is necessary, because the rate of combustion determines the amount of air required.

Visit our factory showroom and see the boiler for yourself; or, if you prefer, write us for a list of the Carburetor Boiler Installations in Philadelphia. Send today for the illustrated and descriptive booklet which gives the facts about space-saving, low water-line of 50", long life and fuel saving. Address Dept. BG 12.

**Bungalow**, Cape Charles, Virginia, \$5,000. Architect, John A. McKibbin, Industrial Trust Building, Wilmington. Owner, care of C. C. Mammele, Fourth and King streets, Wilmington, Del. Frame, 1½ stories, 35x35 feet, shingle roof, pine and oak floors, electric light. Owner will build.

The valuable man in any business is the man who can and will co-operate with other men. The foreman who opposes the introduction of a new man into an institution and fights every innovation which he himself does not suggest, is doomed to a gradual and creeping defeat. Men succeed only as they utilize the services and ideas of other men. Co-operate!

## Proposal

### ADVERTISEMENT FOR THE CONSTRUCTION OF BUILDINGS FOR THE N. J. SCHOOL FOR THE DEAF, TRENTON JUNCTION, N. J.

Public notice is hereby given that sealed proposals for furnishing labor and materials to construct and equip ready for furnishing the following buildings for the School for the Deaf, will be received by the Architects at the State House, Trenton, New Jersey, on Monday, the 29th day of December, 1924, at 2.30 o'clock P. M., at which time all proposals submitted will be opened and publicly read. The buildings are as follows:

ITEM "A"—The Main School Building. This includes the School and Administration Building, Dining Hall and Kitchen, Auditorium, Gymnasium, and Locker rooms. This building to be constructed with concrete and brick walls and fireproof construction, and contains approximately 724,000 cu. ft.

ITEM "B"—The Shop Building. This building to be constructed of concrete and brick walls—fireproof construction and contains approximately 171,000 cu. ft.

ITEM "C"—The Laundry Building (addition to Boiler House). This building is to be constructed with concrete and brick walls and semi-fireproof construction, and contains approximately 64,000 cu. ft.

ITEM "D"—The Superintendent's House. This is an alteration to the old stone building, and a frame addition thereto, containing approximately 20,000 cu. ft.

These buildings are to be erected on the grounds of the School for the Deaf, Sullivan Way, near Trenton Junction.

Bids will be received as follows:

Base bids, including items A, B, C, D, will be received for,

General Construction  
Heating and Ventilating  
Plumbing Work  
Electric Work.

Separate bids for items A, B, C, D will be received for,

General Construction  
Heating and Ventilating  
Plumbing Work  
Electric Work.

Said Proposals must be on blank forms provided for that purpose, and must be enclosed in sealed envelopes endorsed "Proposals for the School for the Deaf," and must state the branch of work for which proposal is submitted.

No bid will be considered unless accompanied by a certified check to the amount of five per cent. of the bid, or if the amount of bid shall exceed \$200,000.00 in the amount of \$10,000.00 binding the bidder to execute a contract if awarded to him. The terms of the proposal with surety required are fixed by the specifications, to which reference may be had. The right is reserved to reject any or all bids submitted, also, to waive any informality in the same.

Copies of the drawings and specifications may be seen at the Architect's offices, and copies will be loaned to bidders by the Architects on deposit with them of a certified check to their order for the sum of \$50.00. Upon return of drawings and specifications the check will be returned. These drawings and specifications may be obtained by application to Arnold H. Moses, Architect, Temple Building, Camden, N. J.

GUILBERT & BETELLE,  
ARNOLD H. MOSES  
Associated Architects.

Dated December 6th, 1924.

(Continued from Page 804)

3 inch plank of any length over 10 ft. These planks can be used after serving their purpose, where motor trucks alone pass over them.

The road, as a general thing, should make a circuit of the building, except where space limitations forbid, in which case a turn-around must be provided.

The average masonry job calls for uncovered storage for the following: 1. Sand, gravel or cinders. 2. Brick, stone, terra cotta and tile. 3. Steel and iron. 4. Lumber, furring, lath. 5. Sub-contractors' material, as radiators, plumbing fixtures, pipe and the like.

These may have to be accommodated in full and at the same time or in part and in succession according to the system of ordering and delivery. And in laying out the yard due allowance must be made for space made available by material being built in. Thus, in a brick and timber building with concrete foundations, most of the sand and gravel will be out of the way by the time radiators and fixtures arrive, so that they can be placed where the gravel was.

To use definite figures; suppose the building to be a three-story and basement school with 20,000 sq. ft. on each floor. It is of joist construction with concrete foundations and brick walls.

In allotting open storage the superintendent will be guided by the quantities and delivery dates in the job schedule furnished him, and the parts of the work into which each material is to be built.

Those mentioned above are used throughout the building; hence they should be placed in several piles around it—not all in one place. If he decides to set up his mixing plant at one point and keep it there, the sand and gravel must be concentrated at that point.

His order sheet shows that 900 cu. yds. of each have been ordered, to be delivered at the rate of three carloads of each a day, for fifteen days. He expects to use up 48 yds. a day in pouring the foundations, leaving a balance of 300 yds. on hand or to be delivered for the cellar floor.

Taking all contingencies into consideration he would allow space for a maximum of 300 yds. of sand and a like amount of gravel; that is, about 2700 sq. ft. for each, or less, according to the facilities for piling it higher than 3 ft. average. The car-unloading allowance of 1 to 3 days before demurrage begins, will give him some leeway.

The brick order may amount to 300 M and T. C. fire-partition tile to 10 M sq. ft. 12 inch and 20 M sq. ft. 8 inch. A 5 ft. brick stack will require 3,000 sq. ft. of ground area, a loose heap 4,500 sq. ft. The labor of stacking is about off-set by the one-by-one method of loading a hod or a wheelbarrow from a loose

pile. The 12 inch tile will require 2,000 sq. ft. and the 8 inch, 3,000 sq. ft.

Both the brick and tile will be distributed in three or four piles around the building. And here it is in order to advise that temporary openings (apart from the permanent doorways) should be left in the walls of the building to give easy access to any part of it for material.

The steel and iron cannot be stacked unless there are a great many members with the same mark, such as floor I's. Ordinarily a wood-joint building will have only steel columns, girders, lintels and perhaps stair material. These should be assigned plenty of space so that the marks can be seen and the required members taken out without moving other shapes. In a building like the one under discussion, 2,500 sq. ft. will be a sufficient space allotment.

Assume that the lumber list is about like this

Size	Quantities	Ground Space M.F.-B.M.	Sq.Ft.
2x12—1000/20,	300/16=	49.6	830
2x10—2000/20,	600/16=	29.76	500
2x 8—750/24,	150/10=	14.62	250
2x 6—200/16,	=	3.2	60
2x 4—1200/22,	1200/12=	27.2	500
Sheathing:		100.	1600
Furring, etc.			300
Lath: 220 M			450

Total sq. ft. .... 4,490

Say 4,500 sq. ft. net for lumber storage.

Space for sub-contractors' material must next be considered. Ordinarily the radiators, plumbing fixtures, etc., will only be delivered after a large part of the brick, lumber and steel has been built in, so that they can occupy the space so vacated. Thus the cast-iron, tile and steel pipe alone need be considered in planning the first phase of the yard layout, with some room for a pipe bench.

If the sub-contractor is up to his job he will build pipe racks of rough timber so that he can have access to pipe of any size without moving other stock. He will also sort out his fittings in heaps according to size and type. For a building of the kind under consideration, the plumber will need about 1,000 sq. ft. and the steam-fitter 500 sq. ft. The electrician will require 300 sq. ft. and the sheet-metal, and roofing contractor about 800 sq. ft. or more if the building has a duct system.

Add to the above, say, 1,500 sq. ft. for miscellaneous open storage window frames, etc., and the summary of open storage will be something like this:

	Sq. Ft.
(a) Sand and gravel .....	5,400
Brick (stacked) .....	3,000
T. C. Tile .....	5,000
Steel and Iron .....	2,500

Lumber ..... 4,500  
Sub-contractors ..... 2,600

Total ..... 23,000

And this total space requirement is demanded at one time. Add to it 10% for aisles and access; and we have 25,000 sq. ft. in round numbers.

—*Building Age and National Builder.*

## THE BUILDING OF A CONCRETE HOUSE

By JOHN L. BRIGHT, *Architect,*  
*Philadelphia, Pa.*

In the planning of my own house in Ardmore, Pa., I commenced by adopting a practice which is, unfortunately, all too common—the sacrifice of stability and permanence to cheapness. The most ordinary grades of materials and finish were specified but all to no avail, for the final addition was appalling. At that moment I knew the soul of the Client and henceforth he will have my sympathy. But I knew more, for long experience teaches the architect the excessive depreciation and the cost of maintenance inseparable to the use of inferior materials. In this dilemma I decided to try concrete.

I had long been convinced that concrete, properly handled and designed, has many advantages. For all practical purposes it is fireproof. It is also susceptible of very beautiful architectural treatment, a point not always realized because it is employed to such an extent in factories and large engineering works that the possibility of a more delicate treatment necessary in a dwelling, has received but scant attention.

In revising my estimates to suit the new conditions I found that the cost would not be a deterrent factor.

I was interested to see if I could do something beautiful in concrete. I determined to use the chosen material honestly and without any pretense. The outside walls are ignorant of stucco. The board marks show but not to an unpleasant extent. They could have been eliminated at the price of losing the exquisite color which to my mind more than compensates for any lack of evenness. The inside surfaces are hammered or rubbed, as the case may be, and here again the color is altogether lovely. The effect is not one of coarseness. It is rugged, the corners are sometimes chipped, but the general impression is one of extreme delicacy. Perhaps, as the designer, I am lacking in good taste in so praising my own efforts, but concrete has been so manhandled and, as an artistic medium, so little appreciated. I feel that I owe it to the material itself to speak well of it. I gave it a fair chance; in no way did I disguise its natural color, so its appearance was due to itself and very little to

me. I will let others speak of the design of the house and its setting on the hillside.

In the three important rooms on the first floor a veneer of concrete formed of different colored marble chips was used.

Tile was used lavishly in restricted areas. No "spots of color" but big fields of it. Much of it was glued to the forms and the concrete poured against it, a method which avoided any sense of patch work.

A word, and perhaps the most important, must be devoted to the construction of the outside walls—well tamped concrete is waterproof but like any other material the inside surfaces will collect moisture under certain conditions. To avoid this, walls of brick or stone are generally furred or stripped. Not wishing to use plaster, I made the walls 15 inches thick and cast them with double air cells. Each air cell was 24 inches long and about 2½ inches wide, and the two rows were staggered. The walls have been subjected to every conceivable test during a year for leakage and precipitated moisture and are perfectly dry.

The house is now complete and occupied and the general consensus of opinion is favorable. The charcoal stove was regarded with suspicion until after the first meal, and then contentment reigned. I have a house which cannot conceivably burn, in which the cost of maintenance and repairs will be almost nothing. There is no wood trim to paint; no wall paper to be renewed; no rain gutters to corrode. Inside and out it presents an air of solidity and frankness. Its cost is not abnormal and if I knew as much in the beginning as now do it would be surprisingly low.

If I have done something beautiful; if I have contributed my little mite to the cause of good building, my ambition will have been fulfilled,—but *quien sabe?*

## WE ASK YOU

Isn't it funny?  
THAT A MAN WHO CONSIDERS  
HIMSELF A BUSINESS MAN  
Will get up in the morning  
From an advertised mattress,  
And put on advertised underwear,  
Advertised hose, shirt, collar, tie and shoes.  
Seat himself at a table and  
Eat advertised breakfast food,  
Drink advertised coffee or substitute,  
Put on an advertised hat,  
Light an advertised cigar,  
Go to his place of business and  
TURN DOWN ADVERTISING ON THE  
GROUND THAT ADVERTISING DOESN'T  
PAY!

Ideals are like stars; you will not succeed in touching them with your hands, but like the seafaring man on the desert of waters, you choose them as your guides and, following them, you reach your destiny.—Carl Schurz.

## Changing an Attitude of Mind

It has been the tendency of the public to look upon insurance as something on which it must first be "sold" by convincing arguments of the insurance man.

That this attitude is undergoing a change is evidenced in the number of people who no longer wait for the agent to solicit their business but who seek out the agent and ask for insurance advice.

By its national advertising the Insurance Company of North America is helping materially to bring about that hoped for time when people will "consult their insurance agent as they consult their doctor or lawyer."

Represent North America.

## For Lowering the Freezing Point of Concrete—

And making it Permanently Hard and Waterproof

THE addition of "ANTI-HYDRO," a liquid integral compound, to the gauging water, lowers the freezing point of concrete from 15 to 18 degrees, allowing you to work right on through the cold weather.

"ANTI-HYDRO" also makes concrete *permanently* hard and waterproof, all in one operation. Easy to use—simply mix it with the gauging water.

For 20 years "ANTI-HYDRO" has proved to be the best by test.

## As The Editor Sees It

### UTILIZING LIFETIME

BY GERHARDT F. MEYNE

*Address Before the National Vocational  
Educational Society at Indianapolis,  
Indiana, on December 13, 1924*

The problem before the Builder and Industrialist is "How can vocations and education be most practically combined?", as the great majority of people must labor at something productive. Educated people without a desire for labor can be an insufferable evil.

I have no particular regard for educational theories, and have no new theories to propound. In educational matters, I am thoroughly old-fashioned, and believe in creating and arousing a desire to learn to be the "Big Thing." I believe acquiring learning is purely a matter of personal practice, interest, an inquisitive turn of mind and concentration.

Within the memory of most of us, the three R's were considered to be the ample system. Half of our citizens have been educated within them. The three R's of today represent a whole lot more in study and education than formerly. There are but few in the United States who cannot read and write fluently. Many in their more mature years have acquired the love for the literary arts, understand the plays and the classics, but growth of our educational system has all been in the same direction. There is practically no difference in the instruction given to those

who are ambitious to become lawyers, doctors, engineers, architects and other professional men, and the instruction given those who are neither leaning, inclined, nor ambitious towards the professions, who neither have the means, desire, ability nor endowments to enter the professions, but are content to earn an honorable living at a trade or vocation.

Yet most of the education, after the seventh grade, is directed towards the professions. Ninety-two per cent. of our youths do not get to college, approximately five per cent. graduate. Let us look at the somewhat archaic and chaotic system of preparing the ninety-two percent's lifetime in a practical manner.

Let me answer in the terms of my own industry.

In most of our States, our youths are not permitted to go to work at the building trades until they are sixteen years of age. What are we doing for these youngsters, and how are we utilizing their lifetime for the benefit of themselves, the public and the future employer? It should not be necessary for the young man who desires to become a building tradesman to be required to burden himself with many of the subjects now taught, and in which he has no interest whatsoever. He should not be required to study the same general subjects as the youth who has a leaning or ambition for the professions.

The general tendency in the High

Schools, as I know them, is to encourage students to become members of the professions,—the average high school instructor, Academician, encourages them unduly towards the professions. For some unaccountable reason, the Academician and the American parent seem to think that the professional class and semi-professional class, such as clerks, salesmen, draftsmen, etc., are considered to possess greater gentility, and they are looked upon by the present and past generation as something superior to the mechanic. Could these good people but see the numerous opportunities that are constantly presented to the vocationally trained man who knows his trade fundamentals and could they but know of his yearly income, they would view him in appreciation instead of depreciation. The vocationally trained man can take advantage of these numerous opportunities by continuing his education in night courses, short term college courses, etc. He cannot only aspire to the heights in industry, but, what is more, if he applies his endowments, training and ability, he can actually "arrive."

Probably nothing indicates the justification for the present demand of vocational education more than the fact that numerous college men graduating from the literary arts and science courses are turning towards the vocations as a means for a livelihood. It is not infrequent that one finds men of several years' col-

PRINTS**

lege training endeavoring to get into the industries. When one stops to think of it, one feels that they have not utilized their lifetime to the fullest, have probably acquired considerable needless information. Of course, time spent in any education is not time lost, but many subjects that do not interest the student are taught in our present high schools and the boy who does not go to college must wrestle with them, when his time could be turned to greater practical advantage.

The Federal Board of Vocational Education has made up a chart based on the 1920 census, and shows some very remarkable figures and percentages, when analyzed. It has been published and discussed before.

The Builder and Industrialist who looks at his chart in reverie and meditation, (if he will take time to study the chart at all) I believe, will agree with me that the lifetime of our youths could be turned to greater advantage to the Nation and to themselves, if the educator would take advantage of utilizing the years that are so often dribbled away because of lack of interest in the subjects taught. The chart reveals that there are two millions of our young, between the ages of five years and twenty years, in our schools. Of these two millions, ninety-two per cent. leave schools between the ages of thirteen and twenty to go into some industrial, commercial or agricultural pursuit. What are we, the public, and you educators doing to prepare them for this new thing that they are facing? Let us go back to the chart! The egress from school is about as follows:

125,000 or 6% leave between the ages of 13 and 14 years, another 125,000 or another 6% leave between the ages of 14 and 15 years. When we come to the ages of 15 and 16, the figures jump considerably and show that 400,000 or 20% leave your school for one reason or another. 300,000 or 15% leave between the ages of 16 and 17 years. Another 400,000 or another 20% leave between the ages of 17 and 18,—all of these to engage themselves in some life occupation. Are we doing everything to fit these young people with an understanding of what confronts them? Have we developed their capabilities to shift for themselves? For, in biological terms, we may consider them weaned.

Now we come to the college age, and find that only a small percentage are left to enter college, and the chart shows that the youths are leaving college at the rate of 100,000 to 200,000 each year, and that only a very small percentage,—approximately only five per cent. graduate. Yet the entire curriculum, in most instances, from the ages of 13 to 20, has been set and made up for the purpose of entering the youths into college. I ask again,

have we utilized the lifetime at our disposal efficiently?

There are whole libraries written on vocational and apprenticeship education and training, but there is no need of giving historical back-ground to this subject. I would like to give you the viewpoint of a builder. He may not be qualified to address you because of his lack of degrees, but he has served apprenticeships in a trade and has worked through the various steps and is proprietor of his business. He is tremendously interested in vocational education. He is training numerous boys under various systems. Personally, I believe the old "Indenture System" has outlived its usefulness. It is no longer necessary for the master to provide shelter, food and clothing for the boy. It is no longer necessary to teach him to read and to write, as usually was his obligation. He now pays him the wage he is able to earn. The parents and school usually provide the other.

I hope to see that the public schools of today will be the vehicle of training the industrial arts as were the medieval monasteries of the eighth and ninth centuries. We know that it was usually a willing exchange of manual labor for protection, teaching and subsistence, either within the monasteries or to those who lived near them. Those who would gain knowledge were obliged to give their labor free in exchange for learning, protection and living, creating practically a condition of servitude. This condition no longer exists.

The thinking Builder and Industrialist is no longer vying for the Freedom of Labor, but for the Dignity of Labor, and general industrial freedom, and I believe that the time is here where the public school is taking the place of the old monastery, the time of servitude is past, the time of the old practice of indenture is slowly passing. Especially is this true in the building industry.

The builder is confronted by a peculiar situation in obtaining and teaching boys. The builder is in competition with other employers for the services of the boys. The semi-skilled trades are able to offer to the young man much greater pay,—the boy can, in a comparatively short time, acquire the knowledge of running machinery and become a producer. He can earn big money by driving motor trucks and, in his limited course of reasoning, he does not see the opportunities and advantages of becoming a highly skilled artisan. It takes considerable of his time and, by reason of the cost of his training, his pay must naturally be less than that in the semi-skilled trades. We builders, I say, are in competition for these boys, and unless the boys' parents are able and willing to help

electric light. Owners taking bids due January 5th.

**Residence and Garage**, Narberth, Pa. Architect, E. K. Taylor, 1416 Chestnut street, Philadelphia. Owner, O. V. Kruse, care of architect. Hollow tile and stucco, 2½ and 1½ stories, 20x50 feet, wing 10x18 feet, garage 20x20 feet, shingle roof, oak, pine and cement floors, hot water heat, electric light, tile work (alternate slate roof). Architect taking bids due January 5th, 1925.

**Residence and Office**, Hanover street, Wilkes-Barre, Pa., \$25,000. Architects, J. Boyle and T. Newman, Bennett Building, Wilkes-Barre, Pa. Owner, Dr. J. W. Cresler, 152 Hanover street, Wilkes-Barre, Pa. Brick, hollow tile, 2½ stories, 31x45 feet, slate roof, hardwood and rubber tile floors (heating, plumbing and electric reserved). Owner taking bids due January 2nd.

**Store House**, Fort Mifflin, Pa. Architects, United States Engr., War Department, 1307 Schaff Building, Philadelphia. Owners, U. S. War Department, care of F. G. Boggs, 1307 Schaff Building, Philadelphia. Low bidders: W. L. Morrison Contg. Co., Washington, D. C., \$22,400; Wm. Thurston, Richmond, Va., \$23,700.

**Eagles' Home**, Wilkes-Barre, Pa. Architects, Schroeder & Schmidt, Weitzenkorn Building, Wilkes-Barre, Pa. Owners, Order of Eagles, care of architects. Lowest bidder: M. L. Roth, 127 South Welles street, Wilkes-Barre, Pa.

**School**, Forty Fort, Pa. Architect, William B. Ittner, Board of Education Building, St. Louis, Mo. Owners, Wilkes-Barre Institute, Dr. H. B. Gibby, Wilkes-Barre, Pa. Lowest bidders: Murch Bros., St. Louis, Mo.

## Pennsylvania

### Contracts Awarded

**Store and Apartment**, Glenside, Pa. Architect, H. Trumbauer, Land Title Building, Philadelphia. Owner, Edwin N. Johnson, Glenside, Pa. Brick, cut stone, stucco, 2 stories, irreg., slate roof, oak and pine floors, hot water heat, electric light, tile work, metal lath, bond. Contract awarded to A. Zellfelder, 1324 Walnut street, Philadelphia.

**Casa Del Ray Hotel**, Lancaster and Haverford avenues, Haverford, Pa. Architect, T. B. Lippincott and C. H. Schaff, 11 South Sixteenth street, Philadelphia. Owner, Perry Beam, 605 Market street, Philadelphia. Stone, cut stone, steel, brick, hollow concrete block, 3 stories and basement, 210x94 feet, wing 46x49 feet (Webster vacuum heating, oil burning, electric light, plumbing separate bids), slag roof, tile roof, linoleum, oak, cement, natural cork, rubber tile floors, elevator, roof ventilators, waterproofing, ornamental terra cotta, ornamental iron work, bond, tin-clad, kalamein, hollow metal doors, rolling steel skylights, hollow metal sash, tile and marble work, metal lath, electric light, morene wall finish, galvanized work, wrought iron pipe. Contract awarded C. C. Pace, Cynwyd, Pa.

**Residence**, Bryn Mawr, Pa. Architects, McIlvaine & Roberts, Otis Building, Philadelphia. Owner, Edwin H. Le Boutilier, Bryn Mawr, Pa. Stone, cut stone, brick, 2½ stories, 104x30 feet, shingle roof, oak and pine floors, plumbing, metal weather strip, flagstone, bond, tile and marble work, hot water heat, electric light. Contract awarded H. G. Campion, Otis Building, Philadelphia.

**Garage**, Haverford, Pa. Architects, McIlvaine & Roberts, Otis Building, Philadelphia. Owner, Rodman E. Griscom, Haverford, Pa. Stone, 2½ stories, 48x32 feet, shingle roof, oak and pine floors, plumbing, hot water heat, electric light, bond, ornamental iron work. Contract awarded H. G. Campion, Otis Building, Philadelphia.

**Hospital (add.)**, Sixth and Washington streets, Reading, Pa. Architects, Ritcher & Eiler, 147 North Fifth street, Reading, Pa. Owners, Homeopathic Hospital, on premises. Reinforced concrete, brick, steel, 4 stories and basement, 69x36 feet, built-up roof, cement, composition and linoleum floors, hollow tile, plumbing, waterproofing, dampproofing, ornamental iron work, iron stairs, bond, hollow metal doors, galvanized steel sash, tile, marble and terrazzo work, metal lath, steam heat, electric light. Contract awarded to Fink Const. Co., 658 Penn street, Reading, Pa.

**Silk Mill (add.)**, Allentown, Pa. Architects, Jacoby & Everett, Commonwealth Building, Allentown, Pa. Owners, Majestic Silk Mills Co., care of architects. Brick, structural steel, 2 stories, 66x213 feet, built-up roof, wood floors, elevators, waterproofing and dampproofing, steam heat, fire doors, electric light, rolled steel sash, iron stairs. Contract awarded to Butz & Clader, Ainey Building, Allentown, Pa.

**Gymnasium Building**, Easton, Pa., \$61,990. Architects, Michler & Snyder, Drake Building, Easton, Pa. Owners, Board of Education, Easton, Pa. Brick, steel, cast stone, 2 stories and basement, 83x123 feet, slag roof, cement and wood block floors, hollow tile, roof ventilators, metal lath, terrazzo work, ornamental iron work, stone, bluestone, slate (plumbing, heating and electric work separate bids). Contract awarded to Benjamin Ryman, Phillipsburg, N. J.

**Store and Office**, Olyphant, Pa. Architect, J. J. Howley, Traders' Bank Building, Scranton, Pa. Owner, W. J. Lynott, Olyphant, Pa. Steel, brick, cut stone, 2 stories and basement, 25x90 feet, slag roof, maple floors, hollow tile, metal ceilings, steam heat, electric light, metal lath, tile and marble work, rolled steel sash, store fixtures. Contract awarded to S. Palumbo, 537 Linden street, Scranton, Pa.

**Store and Offices**, Olyphant, Pa. Architect, J. J. Howley, Traders' Bank Building, Scranton, Pa. Owners, Cannon Bros., Olyphant, Pa. Steel, brick, cut stone, 2 stories and basement, 25x90 feet, slag roof, maple floors, hollow tile, metal ceilings, plate glass, copper work, ornamental iron work, tile and marble work, metal lath, steam heat, electric light. Contract awarded to S. Palumbo, 537 Linden street, Scranton, Pa.

**Bank**, George street, York, Pa. Architects, Gemmill & Billmeyer, Rosenmiller Building, York, Pa. Owners, Drivers' & Mechanics' Bank, York, Pa. Stone, steel, marble, 1 story, 29x150 feet, Barrett roof, marble and cork floors, metal window guards, waterproofing and dampproofing, cut stone, ornamental iron work, iron stairs, bond, bank fixtures, bronze work, tile and marble work, metal lath, steam heat, electric light. Contract awarded to Hess Brothers, Grantley and King's Mill road, York, Pa.

**Yard Office Building**, Bethlehem, Pa. Architect, private plans. Owners, Philadelphia & Reading Railroad Co., Twelfth and Market streets, Philadelphia. Brick and concrete, cut stone, steel, 1 story, 18x24 feet, slag roof, cement floors, electric light, metal lath, plumbing, bond, ornamental iron work, dampproofing. Contract awarded Forrest Speck Const. Co., Bethlehem, Pa.

**School**, New Philadelphia, Pa. Architect, J. A. McGlynn, Simon Long Building, Wilkes-Barre, Pa. Owners, New Philadelphia School Board, Mr. Dooley, secretary, New Philadelphia, Pa. Frame, 2 stories and basement, 144x80 feet, slag roof, pine floors, roof ventilators, electric light. Contract awarded to Alimo Bros., Pittston, Pa.

**Farm Manager's Residence**, near New Centerville, Pa. Architect, H. Gordon McMurtrie, Norristown, Pa. Owner, Jesse Walker, care of architect. Frame and plaster, 1½

stories, 28 feet 4 inches x 36 feet 10 inches, steam heat, electric light, shingle roof, pine floors, stone foundations. Contract awarded Raymond Houghton, Norristown, Pa.

**Church**, Luzerne, Pa. Architects, Schroeder & Schmidt, Weitzenkorn Building, Wilkes-Barre. Owners, Lithuanian Church, Rev. J. Kundrakes, Luzerne, Pa. Stone, brick veneer, 1 story and basement, 48x110 feet, slate roof, pine floors, steam heat, electric light. Contract awarded to J. J. Gibbon, Avoca, Pa.

## New Jersey Construction News

**Hotel Building**, Atlantic City, N. J. Architect, I. Demchick, 1701 Chestnut street, Philadelphia. Owners, Hersh Carleton Hotel, Atlantic City, N. J. Architect taking bids due December 24th.

**Assembly Hall Addition**, Atlantic City, N. J. Architects, Carrere & Hastings, 52 Vanderbilt avenue, New York. Owners, Hotel Chelsea, Atlantic City, N. J. Architects taking bids due January 5th.

**Public Garage**, Ocean City, N. J. Architect, L. L. Headley, 611 Eighth street, Ocean City, N. J. Owner, F. Spiese, 359 Lyceum avenue, Philadelphia. Brick, concrete block and steel, 1 and 2 stories, 90x166 feet, slag roof, cement floors. Architect will be ready for bids in about two weeks.

**Club House and Pumping Station**, Somers Point, N. J. Architect, L. L. Headley, 611 Eighth street, Ocean City, N. J. Owners, Ocean City Country Club, care of architect. Plans in progress. Architect will probably take bids in spring, 1925.

**Bank Building**, Fifth and Market streets, Camden, N. J. Architects, Davis, 3rd, Dunlap & Barney, 1805 Walnut street, Philadelphia. Owners, Land Title Guaranty Co. of New Jersey, 432 Market street, Camden, N. J. Preliminary sketches in progress.

**Hotel**, Pennsylvania avenue near Boardwalk, Atlantic City, N. J. Architect, W. Macy Stanton, 1524 Chestnut street, Philadelphia. Owner, Nur J. Collins, care of architect. Brick, electric light, concrete floors, slag roof, 300 rooms. Plans in progress.

**Theatre**, Greenwood avenue, Trenton, N. J. Architect, William B. Thines, Commonwealth Building, Trenton, N. J. Owners, Hildinger Enterprise, Arcade Building, Trenton, N. J. Fireproof. Plans in progress.

**Apartments (2)**, Trenton, N. J. Architects, W. W. Slack & Son, St. Regis Building, Trenton, N. J. Owner, Bane L. Temple, 29 Hillcrest avenue, Trenton, N. J. Brick, 2 stories, 32x44 feet, slate roof, hardwood floors, hot water heat, electric light, tile work. Plans in progress.

**Residence**, Morris Heights, N. J. Architects, W. W. Slack & Son, St. Regis Building, Trenton, N. J. Owner, Benjamin Skirm, 702 Riverside street, Trenton, N. J. Brick, 2½ stories, 36x42 feet, slate roof, hardwood floors, hot water heat, electric light, tile work. Plans in progress.

**Maternity Cottage (add.)**, Clinton, N. J. Architects, Department of Institutions and Agencies, Division of Architecture and Construction, Trenton, N. C. Owners, Clinton Reformatory for Women, Board of Managers, Clinton, N. J. Brick, hollow tile, 2½ stories, slag roof, pine floors, tile work. Revised plans in progress.

**Residence and Garage**, Sea Girt, N. J. Architects, W. W. Slack & Son, St. Regis Building, Trenton, N. J. Owner, Charles Shick, 1320 West State street, Trenton, N. J. Frame, 2 stories, 60x30 feet, shingle roof, hardwood floors, hot air heat, electric light, tile work. Architects ready for bids.

**Residences (6)**, Cadwallader street, Trenton, N. J. Architect, Walter Hankin, 39 East

State street, Trenton, N. J. Owner, Robinson O'Donnell, care of architect. (2) Frame, 2 stories, 22x38 feet, (2) frame and concrete block, 2½ stories, 24x38 feet, (2) brick and stucco, 2½ stories, 25x36 feet, slate roof, hardwood and pine floors, hot water heat, electric light. Owner will build.

**Stanley Theatre**, Sixth and Market streets, Camden, N. J. Architects, Hoffman-Henon, Finance Building, Philadelphia. Owners, Stanley Company of America, 1916 Race street, Philadelphia. Brick, stone, steel, concrete, limestone, terra cotta, 160x110 feet, slag roof, steam heat, electric light, tile and marble. Architects ready for sub-bids in three weeks.

**Building**, foot of Jefferson street, Camden, N. J., \$22,000. Architect, private plans. Owners, Armstrong Cork Co., foot of Jefferson street, Camden, N. J. Brick, 1 story, 81x44 feet, composition roof and truss roof, pine floors, cement work, electric light. Owners will build.

**Church and Parsonage**, White Horse Pike, West Collingswood, N. J. Architects, Lackey & Hettle, 5 Hudson avenue, Camden, N. J. Owners, West Collingswood Methodist Episcopal Church, W. W. Rehn, 525 Harrison street, West Collingswood, N. J. Stone, cinder block and steel, 1 story and basement, 41x89 feet, wing 55x41 feet, slate roof, cement and maple floors, plumbing, waterproofing and dampproofing, ornamental iron work, bond, tin covered doors, metal lath, tile and marble work, electric light, composition stone, bluestone, Vengrie Block system. Architects taking bids due January 2nd.

**Contract No. 20**, Camden Approach, Third street, East of Fifth street, Camden, N. J. Owners, Delaware River Bridge Joint Commission, Widener Building, Philadelphia. Beams, concrete, concrete piles, structural steel, granite, excavation. Low bidders: Andrew O'Neill, 127 East Mermaid lane, Philadelphia, \$408,161; Fred Snare Corp., 114 Liberty street, New York, \$414,377.

**Fire House**, Audubon, N. J. Architect, William D. Hopkins, Audubon, N. J. Owners, Audubon Fire Co., Vol. No. 1, Audubon, N. J. Low bidder: H. B. Miller, Edgewater Park, N. J., \$20,988.

## New Jersey Contracts Awarded

**Henchman School**, Woodland Manor, Delaware Township, N. J. Architects, Edwards & Green, 34 South Seventeenth street, Philadelphia. Owners, School Board of Delaware Township, Woodland Manor, N. J. Contract awarded H. B. Miller, Edgewater Park, N. J., \$27,180. Heating, Deckman Plumbing & Heating Co., Woodlynne, N. J., \$5,070. Plumbing, Mr. Leopold, Ferry avenue, Camden, N. J., \$338. Electric, Enterprise Elec. Co., 239 South Tenth street, Philadelphia, \$486.

**Office Building**, 227 Federal street, Camden, N. J., \$5,200. Architects, Lackey & Hettle, 5 Hudson avenue, Camden, N. J. Owner, Meyers Baker, care of architects. Brick, 2 stories, 20x48 feet, slag roof, hardwood floors, roof ventilators, vapor heat, electric light, metal lath, ornamental tile work, rolled steel sash and skylights, ornamental iron work. Contract awarded to C. E. Widell, Woodlynne, N. J.

**Garages (14)**, Southwest Corner Second and Mechanic streets, Camden, N. J., \$4,500. Architect, private plans. Owner, William J. Barry, Southwest Corner Second and Mechanic streets, Camden, N. J. Concrete block, 1 story, 8 feet 4 inches x 18 feet 2 inches, slag roof, cement floors. Contract awarded to

George C. Prince, 212 North Thirty-eighth street, Camden, N. J.

**Building**, Northwest Corner Broadway and Whitman streets, Camden, N. J., \$3,000. Owners, American Iron Works, Broadway and Whitman streets, Camden. Brick and steel, concrete block, 1 story, shop 40x100 feet, office 24x28 feet, slag roof, cement and pine floors. Contract awarded to Bezahler & Schulke, 348 Kaighn avenue, Camden, N. J.

**Garage**, Spruce street, Trenton, N. J., \$3,650. Owner, Jack Elfinstein, 729 Pine street, Trenton, N. J. Cement block, 1 story, 18x50 feet, slag roof, cement floors, electric light. Contract awarded to Unger & Shindel, 121 Jackson street, Trenton.

## Delaware Construction News

**Residence**, 1819 Gilpin avenue, Wilmington, Del., \$4,000. Architect, private plans. Owners, Fagan Bros., 1826 Union street, Wilmington, Del. Brick, 2 stories, 15x45 feet, slate roof, pine floors, hot water heat, electric light. Owners will build.

**Residences (5)**, Thirtieth street, below Madison, Wilmington, Del., \$24,000 total. Architect, private plans. Owner, S. Tobasso, Pennyhill, Wilmington, Del. Brick, 2 stories, 19x28 feet, slag roof, pine floors, hot air heat, electric light. Owner will build.

**Residences (4)**, 3308-10-12-14 Jefferson street, Wilmington, Del., \$20,000 total. Architect, private plans. Owner, Charles W. Gooding, Jr., 810 West Twenty-third street, Wilmington. Brick, 2 stories, 14x36 feet, slag roof, pine floors, hot water heat, electric light. Owner will build.

## Miscellaneous Contracts Awarded

**Library**, Fordham, N. Y. Architect, Emil G. Perrot, 1211 Arch street, Philadelphia. Owners, Fordham University, Fordham, N. Y. Granite, Indiana limestone trim, 3 stories, 70x140 feet, slate roof, marble and linoleum over concrete floors, hollow tile, terra cotta, ornamental iron work, bond, kalamein doors, rolling steel sash, tile, marble and terrazzo work, electric light, steam heat, metal lath. Contract awarded Sobray Whitecomb Co., 105 West Fortieth street, New York.

**Separation House**, Wilmington, Del. Architects, private plans. Owners, Wilmington Gas Company, 827 Market street, Wilmington. Brick, 2 stories, 21 feet 6 inches x 18 feet, slag roof, electric work. Contract awarded to J. A. Bader & Co., Lackey Building, Wilmington, Del.

(Continued from page 820)

sustain them for the first few years, it is difficult for us to give the boys all the opportunities they should have to acquire building knowledge. Hence, let us use the public school for this fitting service.

Now then, the builder feels that inasmuch as he is paying taxes for the education of the youth of the country, he also has a right to expect some service from this youth. Inasmuch as everybody, including the poorest among us, who has a dollar to spend for their sustenance, is helping pay taxes, and inasmuch as approximately 50% of the entire State taxation is spent for educational purposes,

the parents alone are not the only ones interested but all of us are interested, and we have a right to expect a general service from each other. It is the part of our civilization complex. The shoemaker, tailor, baker, merchant, clerk, etc., cannot live without my industry. I cannot lead a comfortable existence without theirs. Now, let us realize that in our educational system, and let us utilize the lifetime at our disposal of the young between the ages of 13 and 20, and those who are not particularly inclined towards the professions, teach them something that will be of advantage to them and advance our industries, and hope that later in their lifetime they will become interested in the fine arts and general cultural attainments.

I do not feel that the entire school periods of the boys between 13 and 20 should be engaged in teaching them vocations, but I do feel that, together with teaching them something practical, the seed and desire for learning can also be planted, and if he is endowed with an inquisitive turn of mind, he will learn, by applying himself, much of the culture that is now the requisite of gentility. Should he not be endowed with a desire to know more than the three R's, no amount of tutoring or cramming between the ages of 13 and 20 will give it to him.

I have often been asked what my plan of education would be, so I will repeat it to you. Those boys who are not interested, or who, by reasons of necessity, cannot go into the profession, or whose parents are unwilling or unable to provide the expense of this education, I would like to see started at an early age, put in a sort of cycle course where their vocational leanings can be discovered.

After a boy has found himself, or his vocational leaning has been discovered and has decided he would like to become a building mechanic, then the rudiments of these trades can and should be taught in the public schools. Brick-laying, carpentry, plumbing, steam-fitting, and the various other trades, can be taught advantageously in the public schools. The Public will demand that they be taught in the near future, but I want to go on record that you cannot make a Finished Artisan in the public school. You can teach him the use of his tools, mathematics, drawing, etc., so that when he comes to the Industrialist at the age of 16 or 18 he is able to earn as big pay as the boy who is driving a truck, or the poor, or semi-skilled, machine hand. To become a finished artisan requires knowledge, and the only place it can be acquired is at the building. This competition for the boys and the builders' inability to teach them at an economic wage, is one of the causes of the terrific scarcity of building mechanics.

Even though the builder feels that it is

entirely possible to teach the rudiments of the trades in the public schools, utilizing such time as may be necessary for the seeding of cultural attainments, the elements in civic and community service, etc., yet when the boy appears for the periods set aside for his chosen trade, he should be in the hands of a practical teacher who has gained his experience on the building.

You, in your previous discussions in conventions, have worked out these problems very effectively. Coming back to the practical side of teaching a trade to the boy, you can teach the boy in the brick-laying trade, how to cut brick, how to lay out an arch, how to cut tile, how to lay up the various bonds, how to lay out his corners and lay out a building generally, so that when he comes to a building he is not ungainly,—he knows something of what might be expected of him. A Big Thing to acquire in the building trades is also the moulding and shaping of the body and muscles. It is as necessary for the plasterer to have command of his feet as it is for him to acquire the wrist motion. It is as necessary for him to be able to balance the hock as it is for his eye to watch that part of the work to which he is applying his skill. When a carpenter or marble-cutter is using a chisel, they will always watch the point of the tool and watch the reaction of the hammer blow at the chisel point, and not where the tool is receiving the hammer blow. It is necessary to train the eye, mind and muscle to act in unison, the eye to watch the reaction of the tool and not the hammer stroke. When the boys are young, this can be most advantageously accomplished. When we train a ball player, we do not wait until he is 20 years old; when we train a musician, we do not wait until he is 16 years old. Why should we wait to train the body and muscles of a boy who expects to make his living in the building trades. These are all things that can be taught in the public schools. They are Big Things; they are interesting, and they enable the youths to command a wage, when you dismiss them at 16 years of age, equal to the wage of those who enter the lives of truck drivers and machine hands, with prospects of great future opportunities, only limited to the extent of willingness and application of endowments.

I want to call your attention again to the fact that the periods not required for educational training can be used by the Academician for teaching and seeding the cultural and gentile pursuits.

Then, too, our mechanics know very little of the history of their trade and trade traditions. The building operations of today do not lend themselves to teach boys any of the glorious past in trade achievements. We cannot tell the boy

that next to the implements of war and implements of agriculture, the implements with which he is making his living are the oldest known in the World's history. The building trades can point with pride to the existence of their art for at least six thousand years. They can point with pride to the monuments of the past, and they can be told that the old artificer, before the days of industrial enslavement and class consciousness, enjoyed a social standing equal to that of the professional man.

The practical teacher can develop in the boys a vocational and trade consciousness, trade pride and appreciation for fine workmanship. It can be pointed out to him that it is not sufficient to know enough of the trade to "just get by"; that it is unfair to his brother craftsmen to hold them down to a general level when the wage is based on the production and ability of the poorest workman. We know that a poor workman is a parasite on the good mechanics' ability. We can develop a trade consciousness in the building industries, and develop a set of craftsmen who not only have a Union, but also a Trade.

In conclusion, I want to say a word about vocational guidance work. I want to say that I have a very high regard and appreciation for those engaged in it. I know that their work is often thankless and unappreciated by those who should feel grateful. I cannot condemn the average parent enough for the lack of interest that they have for the well-being of their young. I have asked hundreds of children, "what are you going to do when you grow up?" I seldom find an interesting or deciding answer. When I turn to the parents and ask them, "what is your boy going to be?" the usual answer is "anything that he likes." The boy usually grows up until he graduates from high school or college undecided as to what his life's work shall be. Untold numbers of those who have reached the age of 16 to 20 have enjoyed no vocational guidance, and they usually flit from job to job, ending nowhere. They soon find their level and are unhappy. I believe it is the duty of the Educational Guidance Directors, where they do not find a decided vocational leaning, to INFLUENCE the youngsters towards a trade that, in the opinion of the director, might provide them a living. The little experience that I have had in guiding young people to find a vocation and a place in life, has been heartrending, because the plea for guidance usually comes from young men when they are too old to be placed at a trade and have assumed marital obligations. Every Guidance Director can testify to the lack of interest or lack of concern for the welfare of the young on the part of the parents to influence them towards an honest and

profitable means of livelihood. They are apparently trusting to Providence to provide for them. The sins of omission of the parent in not concerning himself as to what the boy shall do, or wants to be, are visited on the Boy and Society.

## SHOULD GROUND HOUSE LIGHTING CIRCUITS

*Transformer secondaries should always be grounded when carrying less than 150 volts; grounding recommended up to 440 volts.*

The grounding of electrical circuits supplied from the low voltage side of transformers is recommended as a safety precaution by Dr. M. G. Lloyd, Chief of the Safety Section of the Bureau of Standards, Department of Commerce. In a paper presented at the meeting of the International Association of Municipal Electricians, Dr. Lloyd pointed out that grounding reduces the danger of fire and accident by preventing the occurrence on the circuit of voltages higher than expected, such as might result from lightning or from crosses with a high voltage line. Secondary circuits carrying less than 150 volts should always be grounded he states, and grounding is desirable also for circuits as high as 440 volts.

Grounding to water piping systems is considered by far the best where such systems are available, and the objections sometimes urged against this procedure are considered unimportant. Such objections include the likelihood of electrolysis, the danger to employees, and the possibility of overheating the pipes. There is, however, no evidence showing that these objections are valid.

Grounding of electrical circuits to gas pipes should never be done, he states, as such pipes do not have freely conducting joints and the gas they contain is, of course, a nonconductor. Where water piping systems are not available, recourse should be had to artificial grounds consisting of driven pipes, rods, or buried plates. Where soil conditions are not suitable for artificial grounds the use of a system ground wire is suggested. To maintain grounding connections properly, systematic inspection and testing are recommended.

The grounding of secondary circuits may be done either at the transformer or at the building entrance of the service according to the local regulations. Grounding at both places is recommended, thus insuring a multiplicity of grounds on every secondary circuit. The grounding connection at the transformer should be installed and maintained by the power company while the grounding connection at the service entrance is installed by the building owner or contractor.

## TWISTERS

BY MAURICE I. FLAGG,

*Director of Service, The Architect's  
Small House Service Bureau of the  
United States*

THE wise farmer living in certain prairie sections of the Middle West knows that any time during the summer season a twister may hit him. And so he prepares for this attack by planting a windbreak around his house, barn and fields, and even provides a cyclone cellar.

Anyone who has witnessed the destruction caused by a cyclone or twister knows what usually happens to buildings, crops and everything in the path of the storm. The strange results of twisters, the pranks they play with buildings, and the damage they do, seem to me perhaps not unlike the unexpected and disastrous results that so often come to people who build with nothing more substantial than a newspaper or magazine picture, or a sketch of their own to go by. Twisting the dimensions, rooms, roof, porch, and construction to meet their special needs, these people not only warp their building budgets beyond recognition, but they join the ranks of that grand and mammoth old army whose battle flag carries the slogan, "Penny wise and pound foolish."

*Twister Insurance*

It is curious, as one meets home builders, to discover how little concern many of them give to the need for providing a suitable wind break or protection for a home,—something that will aid in forestalling depreciation, loss of money, and the risk of ruining their home by freakish planning.

The best insurance I know of against twisters, and by twisters I mean anyone who steals, plunders, changes or enlarges upon a sketch or house plan, is a well prepared set of drawings by a reputable architect.

One of the most pathetic sights that come to our attention are home builders trying to beat the game and save a few dollars. Usually they begin by unfolding a newspaper clipping or an illustration of a floor plan clipped from some magazine. They have tried to provide additional details themselves, or perhaps through the help of some carpenter or contractor they have amateur sketch plans. It is difficult at times to make these people see how unfair it is to themselves to attempt to save in this way.

*Mired Before Starting*

It is interesting to watch the twists and turns of these houses as they proceed to their final conclusion, which is usually waste. Changes here, alterations there, omissions here, additions there. With no set procedure, no time table as it were, no buying list, no plans, no details, the home

builder using an inadequate sketch is mired in expense before he even starts.

Like the twister spoken of in the beginning of this article, this building project is liable to be warped beyond point of recognition. What is more, the pocket book may be lost in the maelstrom.

Take your own case for example. Suppose you are planning to build and are now getting help or suggestions from some neighborhood carpenter or contractor, someone you know. He may be a thoroughly reliable and honest workman. His houses may stand like the rock of Gibraltar, and yet nine times out of ten he is not a designer. It is not his job.

Don't forget also that his time is worth money. He is not in business because he loves it. Even though he agrees to supply you sketches and plans free, you will pay for this service in the end. It must be included in the total cost of your home.

How unwise it is to proceed on this unsatisfactory basis, when you can obtain, through Bureau service, many of the advantages of complete architectural service at a cost so low that no carpenter, no contractor or sketch artist, no matter how skilled, will produce the same kind of plan and give you the same type of service at less than three times the cost of a Bureau plan. Don't take my word for it, figure it out yourself. At best, whoever prepares your plans will consume far more than \$25.00 worth of time, long before he has arrived at the point where blue prints can be made.

Now, when you buy a set of Bureau documents for \$25.00 or \$30.00, you get plans that have cost between \$200 and \$300.00 to prepare. They give you the skill of not one, or two, or three professional men, but possibly many architects who have sat in conference, discussed the plans, developed the details, prepared the specifications and given you a service which you must have, if you hope to build your house and build well. The difference between a sketch plan and a complete drawing is one reason why architects' services are required. This is not only true of large dwellings, but of a smaller home.

*Another Danger Sign*

So many home builders are penny wise and pound foolish, in an attempt to save a few dollars, that I once more set down here another danger sign. "Don't build from a hit and miss plan." So many people have discovered the truth of this statement after their house has been built, that I wonder at times why the news does not spread faster. I suppose, however, it is the everlasting desire to save a penny here, a penny there, that prompts so many people to attempt building from sketchy drawings. I have seen so many buildings, particularly smaller homes, warped out of shape, twisted beyond recognition and

finally brought to us with the hope that somehow we can save the situation, that I warn you again to beware of twisters.

Get the best advice you possibly can. Pay the small initial cost that a good set of Bureau plans sell for. They will save you time, trouble and worry in the end. They will take you out of the path of the twister and give you protection for your building investment.—*The Small Home.*

## ARCITECTURE ADDS VALUE TO HOME

*Realtor Sees Growing Trend Toward  
Residences Designed by Experts*

From 10 to 25 per cent. is added to the value of a home by authentic architectural style, according to Ogden A. Confer, President of Confer Brothers, realtors, of Minneapolis, and a vice-president of the National Association of Real Estate Boards, in a recent interview commenting on the increasing tendency in new home construction to utilize the services of the trained architect.

"Not only does the architect designed home have greater utility value and add to the beauty of the city, but the services pay for themselves in any sale of the home," Mr. Confer said. "Our estimate that authentic architectural style adds from 10 to 25 per cent. to the value of a home is based upon an analysis of our sales made in the first 10 months of the year.

"The analysis reveals a rapidly increasing appreciation of good architecture, and whether the home is of the small type or big, it apparently has the biggest demand, sells the easiest and brings the highest values if based upon authentic architectural style.

"My own observations, covering a quarter century of experience in the selling of houses convinces me that no one can afford to build without the services of a competent architect.

*A Two Thousand Dollar Increase*

"While a home of ordinary construction, without architectural character in a good neighborhood, may have a market value of say \$8,000, the same expenditure, made in the same place under the direction of a competent architect will build a home which will sell for \$10,000, an increase of 25 per cent. in value actually created by the architect.

"Houses without architecture can be sold only as necessities. They bring the price of so much lumber, brick and plaster. Homes of architectural beauty appeal to a different sense, the artistic appreciation which home buyers will pay to gratify.

"When a town is in its first stages of development, utility is about the only factor taken into consideration in providing shelter. With the growth of the city and

the increase of earning power which goes along with that growth, something more than mere shelter is demanded in a home. So in Minneapolis and other cities today, the homes that are in demand are the homes which have some artistic character, in other words homes upon which competent architects have used their skill and knowledge to build something of beauty rather than four walls and a roof for utility only.

#### *Plenty of Evidence*

"There is plenty of evidence on every hand that builders are beginning to realize the value of good architecture. Some of our cities have been criticized because so many houses have been built without regard to architectural beauty. I believe this criticism soon will pass. The newer sections are making a better showing and remodeling of older homes is improving the appearance of some of the built-up sections. But there is still room for improvement.

"The most saleable homes built today are those which follow some well established architectural style. The Dutch colonial style led in popularity several years ago, and today there is a strong tendency toward the New England and Southern colonial, the English cottage type, the Italian and the Spanish.

"Another important improvement in the appearance of the city would be made if home builders would pay more attention to the grouping of homes. Certain types of architecture clash with certain other types, and actually reduce values. There should be architectural harmony in every block. Home builders should realize that it is to their advantage to consider the appearance of the block as a whole."

Mr. Confer pointed to the down-town and residential sections of Los Angeles as a good example of where the architect has been mainly responsible for the creation of realty values and a beautiful city.

—*The Small Home.*

#### ONLY ELEVEN SIZES OF STEEL REINFORCING BARS AFTER JANUARY 1, 1925

As a result of a conference held at the Department of Commerce in Washington on September 9th, 1924, the following recommendation was made, relative to the manufacture, distribution and use of Steel Reinforcing Bars—round and square:

"In accordance with the unanimous action of the joint conference of representatives of manufacturers, distributors and users of square and round steel reinforcing bars, the United States Department of Commerce, through the Bureau of Standards, recommends that the recognized sizes of square and round steel rein-

forcing bars, in terms of cross sectional area, be reduced to the following:

Size In Inches	Area In Square Inches
1/4 Round .....	.049
3/8 Round .....	.110
1/2 Round .....	.196
1/2 Square .....	.250
5/8 Round .....	.307
3/4 Round .....	.442
7/8 Round .....	.601
1 Round .....	.785
1 Square .....	1.000
1 1/8 Square .....	1.266
1 1/4 Square .....	1.563

It is further recommended that this reduced list of sizes become effective as applying to new production January 1, 1925, and that every effort be made to clear current orders and existing stocks of the eliminated areas before March 1, 1925."

This recommendation has received practically the unanimous acceptance by manufacturers, distributors and users throughout the entire United States.

At a recent meeting of the Concrete Reinforcing Steel Institute, made up of members of the Reinforcing Bar Interests of the United States, these recommendations were accepted.

Another step forward to more simplified and economical building has been attained.

All industries have agreed to hereafter produce, distribute or use only the eleven sizes of steel reinforcing bars mentioned in the above recommendation.

This was accomplished through the untiring efforts of the Division of Simplified Practice of the Department of Commerce at Washington.

With all indications pointing to the Sixth Annual Meeting of the Associated General Contractors of America, as one of the most significant conclaves in the history of the construction industry, final plans for the three-day convention, which opens at Washington January 12, are now being laid.

Adoption of a code of ethics to govern the relationships of constructors with each other and with other elements of their industry will be the outstanding item of business to be brought before the convention. A tentative set of working rules, already approved by the Executive Board of the association, will be presented to the meeting as a basis for action.

Officials of the association are pointing to the fact that the organization, now completing the sixth year of its existence, has completed its period of pioneering effort and is now thoroughly equipped to indulge in definite and productive action

not possible at times when it was less mature. They cite the impending action on the code of ethics and also plans for effecting broad application of the recently adopted standard contract forms to bear out this statement.

Indications are that the convention will be exceptionally well attended because it is being held in the nation's capital, thus affording constructors the opportunity to enjoy a unique and beautiful environment during those portions of their visit not taken up by affairs constructional.

It is certain the subject of reform in present bonding practices will receive major attention, as important meetings devoted to this matter have been held by the constructors, state highway officials and surety officials since the association held its most recent convention in Chicago last January.

Recapitulation of the results of the organization's protest against the mixture of politics with business by use of the day labor system of constructing public works will be made. The past year has seen much activity in this connection and observations gained during this period will be put to use in the forming of plans for the future.

The standing committees of the association will present their reports and officers for the coming year will be elected in addition to the other business coming before the convention.

There is not a business one can think of, which is not full of little temples where one can curse or pray. Every business that one knows has its host of light in it, fighting against its host of darkness; one set of men conducting the business as if they and the public were engaged in a sort of mutual enthusiasm and daily service, with permanent success as the goal; and another set of men whose success is ruining the business to which they belong, and the public besides—and themselves.

The other day a prominent local architect called up to inquire regarding a concern that has not advertised with us for two years. "I saw their ad. some years ago in the Guide," said the architect, "and am unable to recall just where they are located." We gave him the address and learned subsequently that as a result the firm bagged a big order. How many similar orders, from architects who wouldn't take the trouble to look them up, that same concern has missed in the course of the

The man with an order to place doesn't hunt you up in the city directory these days. He hasn't the time. If he can't find you in your trade magazine he can and does find somebody else, and that somebody else books the order.

## Changing an Attitude of Mind

It has been the tendency of the public to look upon insurance as something on which it must first be "sold" by convincing arguments of the insurance man.

That this attitude is undergoing a change is evidenced in the number of people who no longer wait for the agent to solicit their business but who seek out the agent and ask for insurance advice.

By its national advertising the Insurance Company of North America is helping materially to bring about that hoped for time when people will "consult their insurance agent as they consult their doctor or lawyer."

Represent North America.

## As The Editor Sees It

**H**APPY NEW YEAR! Many say the time-worn phrase so glibly, with so little realization of its deep, hidden meanings. Happy New Year indeed to all of us who go home at night to cheerful warmth, good food, and comfortable beds; and who go forth in the morning well clad against the vigors of the weather.

We know a man who took Christmas cheer to a poor family this year. The mother of this little family of five children told the donor of the Christmas basket that the kiddies had never believed in Santa Claus because this was the first time they had ever had any Christmas celebration. Probably none of us who read this incident can possibly appreciate what it really signifies in pinching, want, sacrifice and heart ache. Most children and grown ups, too, have so much more than they actually need, that such dire poverty is beyond their power of comprehension.

Let those who dislike the hustle and bustle of the holiday season remember that there are thousands of little children whose tiny dreams come true only at this time of the year, and that there are many people whose generous instincts would be entirely swallowed up in the press of business and affairs, were it not for this celebration of the birth of the Christ Child.

To all of us, then, who have lived in peace and plenty during the past twelve

months this new January 1 is indeed a Happy New Year.

Those in the building trades have special cause for rejoicing this year, for in spite of depression in many other lines during the past year; in spite of the general uncertainty due to the Presidential elections, the Building Industry had a very satisfactory year in 1924. As to 1925 the prospects are still brighter. As *Building Age and National Builder* prophesy the Building industry for 1925 is promising.

"Election day has come and gone, and with it any doubt or uncertainty. We are out of the woods, and for the next few years at least the nation takes prosperity for granted.

How much of this prosperity is to be yours? How many of the new dollars that will come into circulation will find their way to your pockets?

If the answer could be given now, a program for future years might be launched in January that would enable builders to take full advantage of the prosperity to come. Can the future be forecast?

We think so. The barometer of American activity—the stock market—has already spoken. Its message is known to you! and to many, no doubt, it brought sweet music. Its behavior was more than an indication. It proved beyond a doubt a new-born confidence, a sense of real

security, and a willingness to open the purse strings.

These are all that America needs: a calm feeling that business will not be artificially disturbed, and a stirring of the adventurous spirit that has made it the greatest industrial nation in the world. These two have come, and the result should no longer be in doubt.

But the builder and the material dealer and the other factors in the building industry may want something more closely identified with their own particular line before passing judgment on 1925 and the ensuing years. There is much accurate data on which to build a forecast.

A nation-wide survey just completed by S. W. Straus & Company, reveals that in cities of more than 10,000 population a building shortage in excess of \$4,000,000,000 exists.

There is the fact that in 1924—an election year—the volume of building up to the end of November has already surpassed by nearly 12% the total for the entire year of 1923, and that a gain of nearly half a billion dollars may be expected when the final returns for this year close on December 31.

There is the fact that contemplated new building is showing rapidly mounting gains unprecedented for this time of the year.

There is the fact that owners and builders throughout the country are responding to the educational campaign of

**DRAWING  
MATERIALS**

KEYSTONE PHONE, RACE 3519

**BLUE  
PRINTS**

the Department of Commerce and other Associations to abolish the winter cessation of work, and to continue the construction industries through the entire twelve months of each year.

There is the fact that labor questions are in a more settled state than for a long period past, and that the outlook for disturbances in this direction is remote.

There is finally, the stabilization of the material market, which in some respects displayed a slight downward tendency during the early months of the fall.

**T**HE combination of all these factors point to but one thing: a maintenance of the high record of building operations throughout the country, with the normal annual volume increased by the growing necessity of making up the shortage which remains as a hang-over from the war period.

A supplementary survey of cities under 10,000 population revealed that the amount of deferred construction in these small towns is commensurate with that existing in the larger cities. A large portion of the shortage revealed by our own exhaustive survey of last year has still to be overcome before a normal basis is reached, despite 1924 construction.

An additional factor in prospective building was disclosed by the fact that during the next two years the sum of \$800,000,000 is to be expended for churches, hospitals, charitable and educational institutions. These figures are not included in the record of building shortage of the urgent and imperative kind.

The analysis reveals that the Eastern states lead in the number of buildings that are urgently needed, the total valuation amounting to \$2,312,510,000. To restore these cities to normal living conditions, the sum of \$1,652,887,500 should be expended immediately for residential construction.

The same demand for commercial types of buildings comes from the South, where 72 cities (out of 103 investigated) report

the sum of \$137,515,000 necessary for such construction, while \$307,495,000 is placed as the amount of the shortage in all building lines.

The seven states of the far West report the smallest shortage, the figures amounting to \$281,115,000, of which the largest proportion is to supply urgently needed public buildings to house the Federal, state and local government offices.

**T**HE spur which has been given to all-year-round construction by the Department of Commerce has resulted in the planning of much winter work, and the concerted efforts of many important organizations to bring about a schedule of building operations which will completely eliminate the seasonal decline characteristic of former years.

Thus in every direction is seen not only a preparation for immediate growth and development, but an actual realization of it. An upward trend has definitely begun. By January 1 it will be in full swing. Your own profits should be in proportion to the growing scale of business in your line.

1925 will be a good building year.

#### ZINC USED FOR ROOFING

*By Chas. E. van Barneveld, Mining and Metallurgical Engineer, Bureau of Mines, Department of the Interior*

The information presented in this report is a by-product of studies concerning zinc, and is published in response to various inquiries for information as to the suitability of zinc for roofing. It parallels a previous report of the Bureau of Mines on slate roofing.

#### *Available Forms for Zinc Roofing*

Zinc is available for roofing in three forms: 1. As sheet zinc which may be used advantageously on roofs with as flat a pitch as 1 in 4; laid with standing seam construction for small roofs and with batten construction for large roofs. 2. As corrugated sheets, in widths up to 40

## Another Notable Residence Superbly Heated

A thing of gleaming beauty in the morning sun and an architectural vision under moonlit skies, the Trowbridge residence is the fulfillment of the kind of commission architects dream about.

The site itself was an inspiration—a point of land enhanced on three sides by rolling beach and the sapphire waters of Long Island Sound.

The client wanted perfection and was able and willing to pay for it.

In selecting the heating system for such a residence—exposed to sea-borne winds—absolute comfort was a *sine qua non*—and the Novelty Carburetor Boiler installed makes it a certainty.

A side-feed, sectional boiler, the Novelty is admirably adapted to large buildings. The Carburetor Chambers (one to each section) on the rear of the boiler, automatically mix all smoke, gases and carbon with oxygen from the air and burn them. The air enters top and bottom slots in the rear of each carburetor, as shown in the picture. *No adjustment of air intake is necessary. Rate of combustion determines amount of air required.*

Address Dept. BG 12, for illustrated and descriptive booklet giving worthwhile facts about space saving, low water line of 50", long life, and fuel saving.

(Continued from page 836)

inches and in lengths up to 8 and 9 feet, available for siding and roofing in industrial buildings (with certain restrictions) and for farm buildings (without restrictions). 3. In the form of shingles.

### Advantages of Zinc Roofing

1. Zinc is a permanent roofing material; that is, when suited to the conditions, and properly applied to a roof

designed with the right purlin spacing, it will outlast the building and still have a salvage value equal to at least half the original material cost. 2. It is applicable to a wide range of conditions, from the most expensive to the cheapest type of construction, and is not greatly above the cheaper materials in first cost. A permanent roof of simple outline need not cost over \$15 to \$25 per square (100 square feet), depending upon the method of construction required; a corrugated sheet roof for industrial purposes or for farm use need not cost over \$15 per square for ordinary conditions. 3. Corrugated zinc sheets have the distinct advantage of being available for re-use and re-construction if handled with ordinary care. 4. Zinc oxidizes to a certain point, building up a strong, protective coating which in time effectually checks further oxidation; thus it does not oxidize to the point of destruction as steel does. 5. It is light and easily handled.

### Disadvantages Applying to the Use of Zinc for Roofing

On the other hand zinc has some minor disadvantages. Everyone connected with building, from the mechanic to the handy man, is familiar in a general way with the behaviour of steel sheets, and when first brought in contact with the use of zinc must have impressed upon his mind the fact that zinc has certain different characteristics from steel that require different handling.

1. Special fasteners must be used. 2. Provision must be made for expansion; this applies not only to sheets but to pipes; for instance, slip-joint gutter and pipe connections of from 1 to 1½ inches are necessary when zinc down-spouts are used. 3. Zinc must not come in direct contact with other metals (except lead) particularly when wet. 4. Zinc is brittle when cold. Generally speaking it is undesirable to make a zinc installation at temperatures much below 40 degrees F.

When these peculiarities are once understood and the consequent precautions are accepted as necessary to a successful zinc installation, they will be found to be simple enough so that they do not constitute an objection to the use of zinc. In addition, there are certain conditions under which zinc should not be used at all. These conditions apply principally to industrial installations and will be briefly discussed: 1. A zinc roof is not suitable for a smelter building or foundry; the combined effect of excessive heat and corroding fumes being too severe. The melting point of zinc is 786 degrees F. Long before this point is reached a corrugated zinc sheet laid on purlins would sag and be unable to support its own weight. Just what that point is has not been determined. The critical temperature of rolled zinc is 280 degrees. Just

how much greater temperature a corrugated zinc sheet of 14 gage supported on a 4-foot span would stand before sagging of its own weight, would be hard to say 2. Zinc should not be used on ocean front construction where it would be subject to continuous salt water spray; neither should it be used under conditions which might produce electrolysis. By way of illustrating the latter point the following case might be cited: In the vicinity of New York, on the Hackensack Meadows, a metallurgical company has used considerable corrugated zinc in construction. This is giving good service with the exception of one unit which is subject to a combination of carbon deposit from smoke and salt water spray, thereby setting up electrolysis which destroys the zinc. Salt air alone is not injurious to a zinc roof.

The possibility has been suggested that an electrolytic couple destructive to zinc is set up when zinc sheets are placed directly on iron purlins, especially in contact with moisture. However, zinc may be placed direct on properly painted iron purlins, or 1-inch wood strips may be bolted to the purlins.

3. Zinc should not be subjected to direct concentrated sulphuric acid or nitric acid fumes; but it does not suffer from reasonably dilute fumes which would be detrimental to steel sheets. Reference has already been made to the progressive weathering or corrosion of zinc which produces a protective coating of uniform depth on any rolled zinc of fairly heavy gage, beyond which depth all action ceases. This coating is *not* a zinc hydroxide (which would be affected by even dilute fumes) but is a hard and difficultly soluble basic carbonate which most effectively protects the remaining metal. The following circumstance will perhaps serve to confirm this statement. In 1908 the Illinis Zinc Co., of Peru, Ill., built a new office building roofed with 13-gage zinc formed as Spanish tile. This roof is roughly 100 feet distant from the kilns in which zinc sulphide ore is roasted and 200 feet from the stacks of a sulphuric acid plant; it is also in close proximity to the nitric acid plant. Though corrugated galvanized sheets 24-gage last only 4 to 6 years in this plant, this zinc roof, after 25 years, continuous exposure to fumes of carbonic, sulphurous, sulphuric and nitric acids, is today in perfect condition.

4. Zinc is more brittle in cold weather and when in this condition is hard to "work" and easily damaged. In very cold weather it becomes impossible to drive zinc nails and rivets unless they are first warmed and are kept warm until used. Aluminum rivets may be used in any weather, but require preliminary punching. Many workmen or con-

tractors will refuse to do this and in cold weather will use galvanized steel nails which, of course, should never be used on a zinc job as sooner or later some will rust out. Below 40 degrees F. zinc suffers from rough handling. At 25 degrees F. even corrugated zinc sheets are liable to be seriously damaged in construction. Zinc cornice work and construction with zinc sheets should be done only in weather ranging from mild to hot.

5. The tensile strength of zinc is low, about half that of iron; this entails the use of heavier gages, deeper corrugations and closer spacing of supports for zinc sheets. In this respect zinc sheets are at a slight disadvantage. With corrugated steel sheets a maximum purlin spacing of 6 feet is allowable, while with zinc sheets 4 feet is the desirable maximum, and that only for the heavier gages, 14 gage under normal conditions and 15 gage under heavy snow load. For 12 gage the spacing should be 45 inches, and

for 11 gage 40 inches. Corrugations for roofing sheets are  $\frac{7}{8}$  inch deep as against  $\frac{5}{8}$  inches in steel sheets. It is desirable to lay sheets to cover two spans, (three purlins) bringing into play the effect of continuous beam action.

6. Zinc has a greater ratio of expansion than iron. Most of the failures of zinc roofs are traceable to failure to provide for proper expansion and construction corresponding to the range in temperature. Yet there is no mystery and no special difficulty about laying a zinc roof; it is simply a question of understanding the reason for the specifications laid down and following them.

#### Zinc Roof Construction

The gage of zinc used in the United States is the old Belgian gage which is reversed as compared with the U. S. standard gage used for steel sheets. Table 1 gives the respective gages with weights per square foot for plain sheets and corrugated sheets.

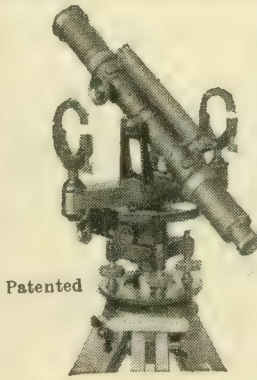

Table 1. Gage, and weights of zinc sheets.

Gage	Thick- ness	Plain sheets	Weight per square foot			
			Sheets with 2½ inch corrugations			
			5/8 inch depth	Max. purlin spacing	7/8 inch depth	Max. purlin spacing
Zinc	U.S. Stan'd inches	inches	pounds	inches	pounds	inches
9	26	0.18	.67	.74	18	0.83
10	25	.020	.75	.83	24	0.93
11	24	.024	.90	1.00	30	1.12
12	23	.028	1.05	1.17	36	1.30
13	22	.032	1.20	1.33	44	1.49
14	21	.036	1.35	1.50	52	1.68
15	20	.040	1.50	1.66	60	1.87
16	18	.045	....	1.85	60	2.10

The  $\frac{5}{8}$  inch depth of corrugation is recommended for siding and the  $\frac{7}{8}$  inch depth is recommended for roofing. The maximum purlin spacing allowable is shown in the columns adjoining weight per foot column for the respective depths of corrugations. The lengths of sheets will be determined by purlin spacing, remembering that it is desirable to space corrugated sheets to cover at least two spans

(three purlins) so as to obtain benefit of the effect of continuous beam action.

End lap and side lap must be provided for in estimating corrugated sheets. The width of corrugations is 2½ inches. At least 1½ corrugations overlap should be allowed at each side, reducing effective covering width of sheet by 7½ inches; from 4 to 6 inches end lap are required

*Rebuilt Instruments of various makes in guaranteed condition for sale or rent.*

at both ends, according to the pitch of the roof, reducing the effective covering length by 8 to 12 inches. (See table below).

*Sq. Ft. of Corrugated Sheets Required to Cover 100 Sq. Ft.*

	Side Lap	End Lap in Inches					
		1	2	3	4	5	6
1	Corrugation.....	110	111	112	113	114	115
1½	Corrugation.....	116	117	118	119	120	121
2	Corrugation.....	123	124	125	126	127	128

Special fasteners are provided to suit all construction needs. It is important to remember that all rivets, nails and bolts are driven through the top of the corrugation to allow for sideways expansion. An anti-condensation roof may be built by stretching over the purlins poultry wire, followed by a couple of layers of sheet asbestos topped with a layer of tar paper immediately under the zinc sheet. Full construction details are obtainable from the manufacturers. Any intelligent workman accustomed to rough building construction who will follow the simple directions can successfully lay

corrugated zinc roofing.

In view of the long life of zinc roofing and the possibility of re-use of corrugated sheets, nothing less than 11 gage should be bought for corrugated roofing under ordinary conditions and 12 to 14 gage under corrosive conditions. Corrugated sheets are made in a variety of widths and no standard width is used. One company presents the following table which makes no allowance for end or side lap. To obtain the covering area, the aforementioned deduction must be made.

Table 2. Square Feet per Sheet Corrugated (No Allowance for Lap)

Length, Feet	Over-All Width, Inches					
	Siding 26 1-4	(1 Corrugation Lap) 34 1-4	Roofing 39 1-2	(1½ Corrugation Lap) 27 1-2	35 1-2	40 1-2
5	10.8	14.4	16.5	11.4	15.2	116.9
6	13.1	17.2	19.8	13.7	18.2	20.2

8	17.4	23.0	26.4	18.4	24.3	27.0
9	19.5	25.9	29.7	20.7	27.4	30.4
10	21.7	28.7	33.0	23.0	30.4	33.7
11	23.9	31.6	37.3	25.3	33.4	37.1
12	26.1	34.5	39.5	27.5	36.5	40.4

For service to which corrugated zinc sheets are adapted—and this covers a very much wider range than the zinc rolling capacity of the country could possibly supply—there is no satisfactory substitute. Zinc sheets are an investment. For use over a 15-year period they will show an actual saving over any competitive material. If properly handled (that is, not roughly handled or misused) they may be re-used any number of times in either new or re-construction as they do not deteriorate and nail holes may be easily soldered. They have a scrap value equal to half or more of their purchase price. In districts remote from zinc smelters their scrap value is higher because scrap zinc is in demand at local brass and babbit works. However, once the value of corrugated zinc sheets is thoroughly understood they will have a resale value greater than their scrap value.

Plain sheet zinc roofs are commonly made of 32 by 96-inch sheets, laid with long dimension up the slope of the roof. The sheets are *not nailed*. They are fastened at the sides either with batten or standing-seam construction.

*Batten Construction:* Sides are fast-

than two sheets, in order that the proper allowance be made for expansion. If the roof slope is between 2 and 3 inches per foot, the sheets can be soldered together in groups of two, and the remaining joints made with a deep double seam that has a lap of about 4 inches, but when covering a flat deck, all joints and seams must be soldered.

In making a soldered joint, the customary lock seam is not used. The upper edge of the sheet is folded over about ¾ inch and 3 by 3 inch zinc clips are locked into it at about 18-inch intervals, or two to a sheet. These clips are then nailed to the roof. The edge of the adjoining sheet is lapped over about 1½ inches and soldered.

Zinc is not difficult to solder. Use cut muriatic acid—that is, muriatic acid that has previously dissolved all the zinc it can,—as a flux. If the zinc has been exposed to the weather for any length of time, it will probably be necessary to scrape it until a bright surface shows before the solder will stick. Use a moderately hot iron, but do not hold it in one place longer than necessary. Ordinary half and half solder is satisfactory.

*Standing Seam Construction:* For small roofs batten type construction is too expensive and looks out of proportion, and standing-seam may be used. The sheets are not nailed but are anchored by strips of zinc. The seams run up and

Both Phones

down and are spaced according to the width of sheet used, which in turn depends upon the gage of the zinc; 12-gage is usually rolled in 24-inch width and 13-gage in 32-inch width.

When the seam is formed the sheets are separated horizontally to allow for sideways expansion. Horizontal or end seams are formed as in batten roofs. For low pitch roofs, that is, under 3 inches in 12, joints are soldered, but total length of soldered sheets should not exceed 20 feet.

**Zinc Shingles:** Metal shingles were brought out in 1882 by Chas. B. Cooper and were first made of terne plate stamped out and painted. Later galvanized iron was used. For many years galvanized shingles and tiles have been made by several manufacturers and there are several designs of lock construction.

Zinc shingles are nailed with zinc nails. Since there are no soldered joints, no provision is necessary for expansion outside of the locked joint and the amount of movement allowed by the rib. They are a little difficult to put on but, once properly put on, they stay in place and give complete satisfaction as to service.

Such shingles cost the consumer around \$13 or \$14 per square in Mississippi Valley points. The shingle is laid on light sheathing which should be covered with building paper in order to prevent rosin from coming in contact with the zinc.

Shingles of this type, that is, large locked shingles, are all made with a raised pattern which has a two-fold purpose—it stiffens the shingle, thus preventing warping, and it allows for expansion and contraction of the metal, no other provision being made for expansion. Some of these patterns are ugly and prove a decided barrier to the general acceptance of zinc shingles for residential roofs.

In some zinc shingles there are two nail holes within an inch of each other; only one nail is to be used; this gives a choice in case either hole coincides with a crack in the sheathing. In other shingles an oblong hole is added higher up for a second nail; by driving the nail in the center of the hole vertical movement is possible without doing damage.

It may be said of zinc shingles in general that, laid intelligently and conscientiously with due regard for instructions, they will give a permanent and satisfactory roof—but the development of the shingle has not yet reached the "fool proof" stage where it can be slapped on by the average "handy man" regardless of instructions.

Shingles, if laid tight up against each other in cold or cool weather when the metal has contracted, will expand appreciably when subjected to a summer tem-

perature range, and the shingle will buckle or work loose.

Zinc is a permanent roofing material and it can not compete with temporary roofing materials as to first cost, but only on the basis of satisfaction, endurance, low maintenance and high salvage or re-use value, over 10 years or longer—the longer the period the better the comparative showing.

All metal roofs have the distinct advantage of being lightning proof when properly grounded, and are practically free from maintenance expense if properly designed and applied. Copper and zinc are the only permanent metal roofing materials now used, and their use is on the increase. Lead was formerly used and gave good satisfaction on many old buildings but the thinner sheets of copper and zinc are now employed.

Zinc costs less than copper, and when properly laid, a zinc roof will outlast the building and will need no maintenance. As between zinc and copper, a zinc roof costs from one-half to one-third of what a copper roof would cost, and has similar scrap value. It also has the distinct advantage over a copper roof that the drip from the roof does not stain light colored walls or trimmings, as often happens with copper roofs. The copper roof on the other hand has a much higher melting point, which may be an advantage in case of fire, provided this is not counteracted by the use of a thinner gage of metal. Copper lends itself better to certain architectural effects and is preferred by sheet-metal workers for complicated cornices requiring sharp bends; copper may be worked cold and applied at any temperature. In these two respects copper has an advantage over zinc. Sheet-metal workers in this country are not as familiar with zinc as they are with iron; therefore zinc is the subject of much prejudice and misuse; this condition, however, is rapidly changing.

For use over a 15-year period corrugated zinc sheets will show an actual saving over any competitive material. If properly handled (not roughly or misused) they may be re-used any number of times in either new or re-construction as they do not deteriorate and nail holes may be easily soldered. They have a scrap value equal to half or more of their purchase price, as previously stated, though the actual scrap value naturally varies with the price of metals.

As a suggestion a comparison is offered between the cost of 24-gage corrugated galvanized sheets 26-inch width and 11-gage corrugated ( $\frac{7}{8}$  inch) zinc sheets—40½ inch width using 8-foot lengths with 1½ corrugations side lap and 6-inch end lap.

121 sq. ft. of 11-gage,  $\frac{7}{8}$  inch corrugated zinc sheets 40½ inches wide, weighing 1.12 pounds per sq. ft.—136

pounds of zinc at 10 cents delivered—\$13.60.

130 sq. ft. of 24-gage,  $\frac{4}{8}$  inch corrugated galvanized sheets, standard width (26 in.) at 6.3 cents per sq. ft. delivered .....\$ 8.19  
Initial cost of paint at \$2.00 per square ..... 2.00

Initial cost of material .....\$10.19

On a 10-year basis, the galvanized sheets will need at least one coat of paint and may need from 2 to 5 coats under severe conditions, each of which will cost at least \$2 per square. At the end of 10 years the galvanized sheets will probably be worthless, whereas the zinc sheets will be good for long additional service, will be available for re-use or at worst will have a scrap value equal to from 50 to 75 per cent. of the cost of zinc (spelter). Thus, assuming the best of comparative conditions for iron—not over one repainting during the 10-year period, no re-use of the zinc sheets, merely assigning them minimum scrap value and deducting a reasonable cost for removal and haulage—zinc sheets show a slight advantage in cost over galvanized sheets.

If the comparison is made for bad corrosive conditions, the galvanized sheets will have to be repainted frequently (at \$2 per square for each application), and perhaps replaced once. On the other hand, every extension of the length of the period will be more favorable to zinc.

**For City Residences:** A zinc roof over a 30-year period will cost less than any other roof. It will still be in good condition at the end of the period and should have a scrap value of at least 50 per cent. of the zinc cost at the time when the building is scrapped.

It is never necessary to paint zinc roofing as a protective measure or to improve its appearance—the color which it takes on upon weathering harmonizes with any architectural scheme into which slate would fit. However, should a color effect be desired as, for instance, red Spanish tile, either the new zinc tile or the weathered tile may readily be painted, provided a paint made of Chinese oil (such as the paints made for enameling purposes) is used. These paints are more flexible and are especially adapted to a metal having a wide range of expansion. It is believed that the flaking tendency of ordinary paints when applied to zinc is due to expansion and contraction of the metal.

**Country buildings and Residences:** Country roofing problems for large buildings differ from city problems in two main points. The poor fire protection on the one hand, the lack of repair facilities and the cost of importing repair labor from the cities on the other hand, both

demand the best roof construction the money available can buy. Zinc can be adapted at moderate cost to all country buildings of a permanent nature. There is no reason why a sheet zinc roof should cost over \$16 per square for standing seam or over \$20 per square for batten construction.

Considering this question in a general way, and having in mind buildings of moderate cost, it would seem that the requirements are: Maximum protection, reasonable first cost, simplicity of application and repair, long life.

Under the head of protection due consideration should be given to the isolation of country buildings, and to the fact that a large percentage of the fire losses come from lightning and from fire brands igniting the roof. A properly grounded metal roof is positive protection against lightning. The average metal roof, where metal is not too thin, is pretty good protection against external fire brands (but no better protection than good asbestos shingles or slate) though it is of little advantage in case of fires starting from within.

The question of cost has an important bearing on the selection of roofing for country buildings. Maximum protection and minimum cost do not go together; yet first cost is perhaps of greater relative importance than it is for industrial buildings.

In considering roofing of country buildings, the house and the out buildings might be considered separately. Within recent years, country residences have improved greatly in design both external and internal. The writer's personal preference for small isolated residences is the asbestos shingle, either individual or strip; but for large houses, sheet zinc roofing (standing-seam construction) is recommended regardless of the higher first cost.

For out buildings of every type, such as sheds and barns, where quarter pitch or better can be had, the corrugated zinc sheet makes the ideal roof and siding. For roofs  $\frac{7}{8}$ -inch depth of corrugation should be used and nothing less than 11-gage metal weighing 112 pounds per foot. For siding  $\frac{5}{8}$  corrugation and 10-gage metal, weighing 83 pounds per square foot is quite satisfactory. These recommendations for gage are made in view of the fact that when properly handled these sheets should serve several generations: they may be stored without danger of deterioration; they may be used in temporary construction, giving maximum protection, and be re-used in permanent construction as all nail holes can be filled with Slater's roofing cement and there is no iron core to rust. The corrugated zinc sheets are applicable to the following types of roofs: Sheds (quarter pitch or steeper), gable (full or broken), gam-

brel, monitor, and half monitor. They can be applied to the Gothic roof, but for a large job the plain zinc sheet with batten construction is perhaps better.

The zinc shingle in its present stage of development is not recommended for country use because of the need of special skill in laying them. Until such skill becomes more common, zinc shingles will probably find their field in and near cities. —*Reports of Investigations, Department of the Interior, Bureau of Mines.*

#### WOULD HAVE STANDARD SIZE FOR SAND LIME BRICKS

When the Sand Lime Brick Association holds its annual meeting in Trenton, February 3 and 4, there will be placed before its members a proposal for the adoption of a standard size. This proposal, which will be offered by H. Ross Colwell of the Division of Simplified Practice, is a result of a series of surveys conducted among the manufacturers of this commodity which disclosed that at present there are being manufactured sand lime bricks in five lengths, five thicknesses and four widths, or 100 possible combinations of size.

Some of the manufacturers and distributors, taking a leaf out of the book of the common brick manufacturers and concrete brick makers, asked the co-operation of the Division in securing the acceptance of a standard of dimensions which call for a length of  $8\frac{1}{4}$  inches, a width of  $3\frac{3}{4}$  and a thickness of  $2\frac{1}{4}$  inches. This is virtually the same as the standard for common, rough face and concrete brick, each of which formerly were made in many size variations.

It is pointed out by the manufacturers who sought the co-operation of the Division in placing this subject before the association that use of a standard set of dimensions would make it infinitely easier for architects, contractors and others, and that there would be important economies to the industry. This claim, it is declared, has been borne out by the experience of the makers of bricks of other materials.

#### BROAD POLICY OF PLASTERERS' UNION DOES MUCH TO UPLIFT THE TRADE

**I**N a recent address before employees of the New York Building Congress, Mr. E. J. Mehren, Vice-President of the McGraw Hill Company, declared that the spirit of craftsmanship was fast departing.

Possibly the speaker had in mind the conditions during and after the war when wages were high and all skilled labor was at a premium, and possibly he was influenced by the statements of some architects who said that good workmen were no longer available.

But happily this does not apply to the plastering trade. Skilled plasterers are available in every community and their numbers are fast increasing, while the broad policy of the National Headquarters of the Plasterers' Union is doing much within the ranks to insure even better workmen for the future.

In 1921 the Master Plasterers' Association reported that only 150 men had become plastering apprentices in 26 cities, while in 1923 the number had been increased to 1800. These men are being trained not only in the best and most efficient methods of their trade, but are also being shown that plastering as a trade can be made as highly respected as any of the professions.

Statistics compiled by the Bureau of Labor show that many skilled plasterers are migrating to this country from Northern Europe and Canada. During the year ending June, 1924, 769 plasterers and their families entered this country, an increase of 52% over the previous year. While this number is not large as compared with the plasterers already in this country, investigation has shown that most of these men were of the best class and the majority were admitted to the union merely upon the demonstration of their ability.

The architect and builder who is desirous of putting all of the beauty possible into his buildings and realizes that this is only possible through the use of permanent plaster can rest assured that the plasterers are fully alert to the possibilities of their own future, and are constantly working towards increasing the efficiency of their trade.—*Metal Lath News.*

#### ALERTNESS PICKS UP ORDERS

Looking for business and just waiting for business makes the difference between success and a bare living.

The DAILY BUILDING NEWS will tell you where to look and make you most alert in securing business.

BUILDING NEWS PUBLISHING CO.  
1530 Chestnut St. Philadelphia.

Advertising is telling who you are, where you are, and what you have to offer the world in the way of service or commodity.

If nobody knows who you are, or what you have to offer, you do no business, and the world is the loser through giving you absent treatment.

Life is too short for the consumer to employ detectives to ferret out merchants who have the necessities of life to sell.

To be poor in a wealthy country, to be sick in a good climate, to be inefficient among a progressive people, is a sign of unwise educational methods. Such people were not taught to battle with the world or meet life's emergencies.—*Thoreau.*

## Changing an Attitude of Mind

It has been the tendency of the public to look upon insurance as something on which it must first be "sold" by convincing arguments of the insurance man.

That this attitude is undergoing a change is evidenced in the number of people who no longer wait for the agent to solicit their business but who seek out the agent and ask for insurance advice.

By its national advertising the Insurance Company of North America is helping materially to bring about that hoped for time when people will "consult their insurance agent as they consult their doctor or lawyer."

Represent North America.

write practically every form of insurance except life

## "Freezing Weather Didn't Hold Up Concrete Work On This Building"

By using "ANTI-HYDRO" for gauging cement in freezing weather, perfect hydration is obtained without weakening the concrete. In fact "ANTI-HYDRO" increases the tensile strength of concrete and makes it **permanently** hard and waterproof.

There is a big market for "ANTI-HYDRO" during the winter as well as the balance of the year. It is a sure-fire repeat order getter. Its 17 year record of success is the best guarantee that could be written.

Our 100% dealer co-operative plan is a money maker. If there is no "ANTI-HYDRO" dealer in your territory, write for it at once. Do it TODAY.
